Issue 03/2017 • Technical details subject to change without notice.

Overview

Why frictional shaft-hub-connections?

Frictional shaft-hub-connections are standard machine elements used to connect shafts and hubs. They are capable of transmitting torque, axial forces, radial forces and bending moments.

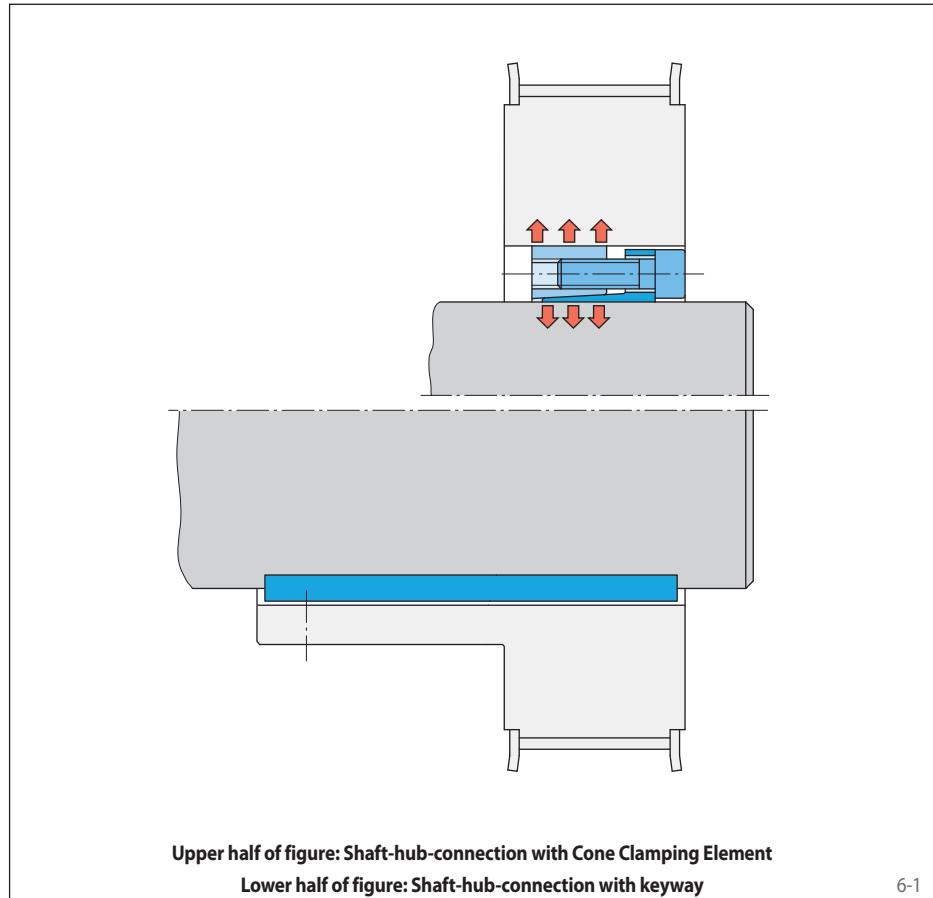

Shrink Discs and Cone Clamping Elements

Among the frictional shaft-hub-connections Shrink Discs and Cone Clamping Elements take an important position. By tightening clamping screws conical surfaces are pulled together generating radial forces; these forces provide the required frictional connection between the parts involved in the transmission of torques or forces.

Shrink Discs and Cone Clamping Elements are capable of transmitting much higher torques than conventional positive connections with keyways. The shafts can be designed smaller and shorter. The relationships between shaft diameter and shaft length are illustrated in the example shown in figure 6-1. In this comparison, the same torque is transmitted via a Cone Clamping Element (upper half of the figure) and via a keyway connection (lower half of the figure). The Cone Clamping Element design offers a much more compact and cost effective solution.

Star Discs

A special category of frictional shaft-hub-connection is the RINGSPANN Star Disc. Connections using Star Discs are ideally suited to applications requiring repeated adjustment with adjustment devices in a short overall length.

6-1

Clamping Systems for torque motors

Both complete torque motors and integrated torque motors can be connected by friction to machine shafts with RINGSPANN torque motor clamping systems. In addition to secure, backlash free torque transmission, these systems also ensure precise centring of the torque motor on the machine shaft.

Star Spring Washers as Ball Bearing Compensating Discs

RINGSPANN Star Spring Washers are particularly light spring elements with linear or non linear spring characteristic. They are suitable for application as pressure elements in precision machines and as pressure springs for taking up free movement, and for reducing noise in ball bearings.

Advantages of Frictional shaft-hub-connections

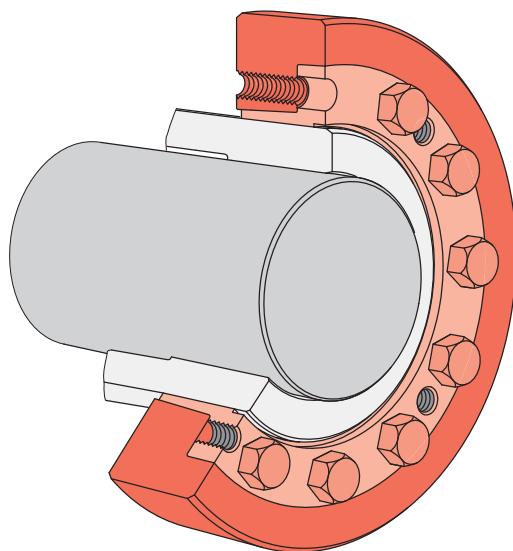

- Backlash free connections
- No notch effect in contrast to keyway connections
- Ideal for reversing operation
- Simultaneous transmission of torque and axial force
- Easy alignment of hub to shaft
- Compact solutions due to high power density
- Reduced costs due to simple shaft and hub geometry
- Connections can be released even after long operation time

of RINGSPANN shaft-hub-connections

Shrink Discs

Shrink Discs are external clamping connections for the backlash free fastening of hollow shafts or hubs to shafts. By tightening clamping screws conical surfaces are pulled together generating radial forces; these forces press the hollow shaft onto the shaft. Torques or axial forces can be transmitted frictionally from the hollow shaft to the shaft. The Shrink Disc itself is not involved in the transmission of torques or axial forces. The radial clamping forces which act through the circumference of the hollow shaft also ensure an optimum centring to the shaft.

Shrink Discs are used, for example, to fasten machine shafts to gearboxes with hollow-shafts.

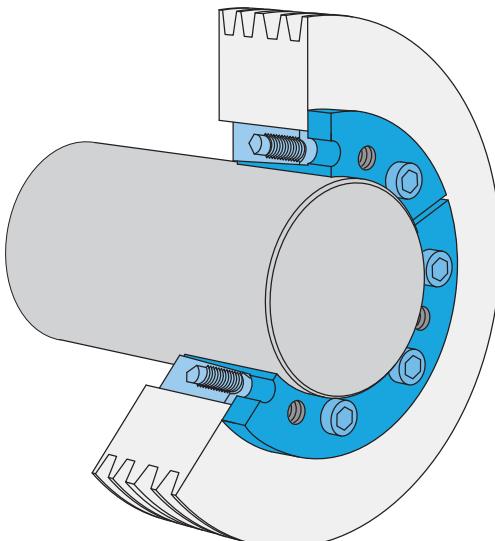

7-1

Cone Clamping Elements

Cone Clamping Elements are internal clamping connections for backlash free fastening of hubs on shafts. By tightening clamping screws conical surfaces are pulled together generating radial forces; these forces create a frictional connection between the Cone Clamping Element and the shaft as well as the hub. Torques or axial forces can be transmitted from the shaft via the Cone Clamping Element to the hub.

Cone Clamping Elements are used, for example to fasten sprockets, flywheels, levers, pulleys, brake discs or conveyor-belt drums.

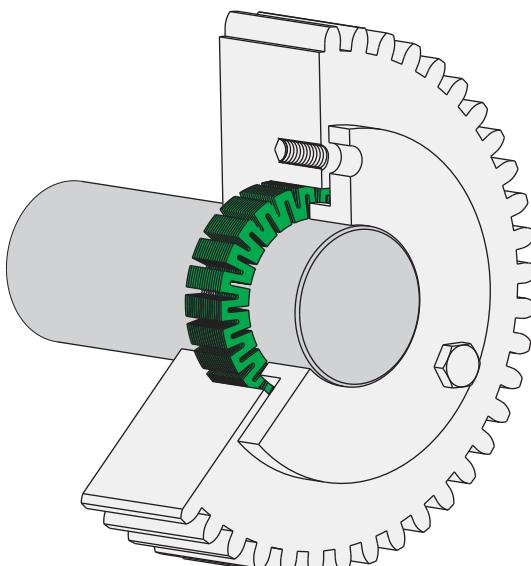

7-2

Star Discs

Star Discs are flat-bevelled rings which are slotted on the outside and inside. An external axial actuating force is translated by the Star Disc into a much higher radial force. This force creates a frictional connection between the Star Disc and the shaft as well as the hub. Generally, Star Discs are installed in a multiple arrangement as a disc pack. This makes it possible to adjust the transmissible torque to the requirements of the specific application.

Shaft-hub-connections with Star Discs are used wherever frequent clamping and release are required, for example in adjustment devices.

7-3

with the RINGSPANN Calculation Method

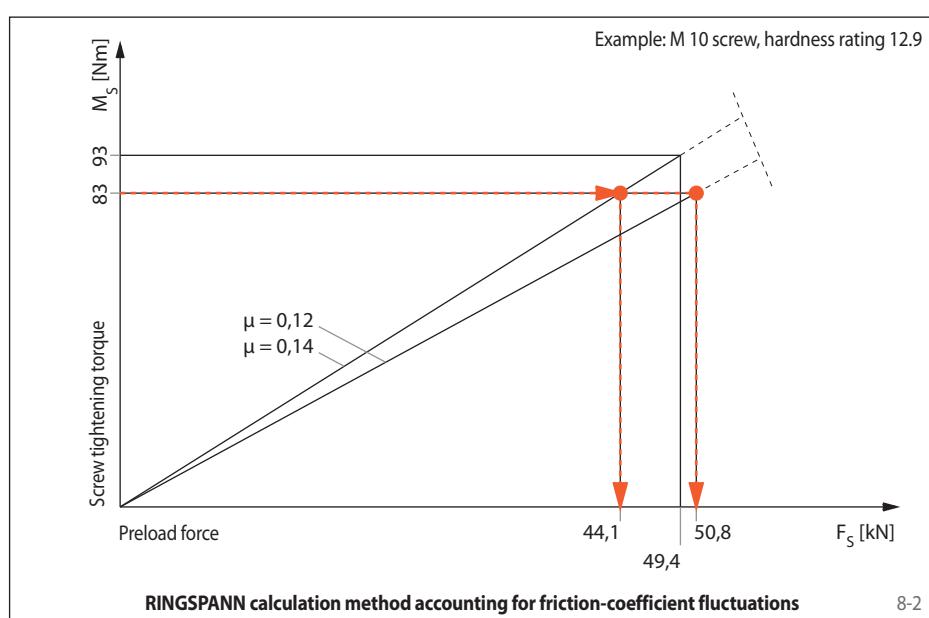

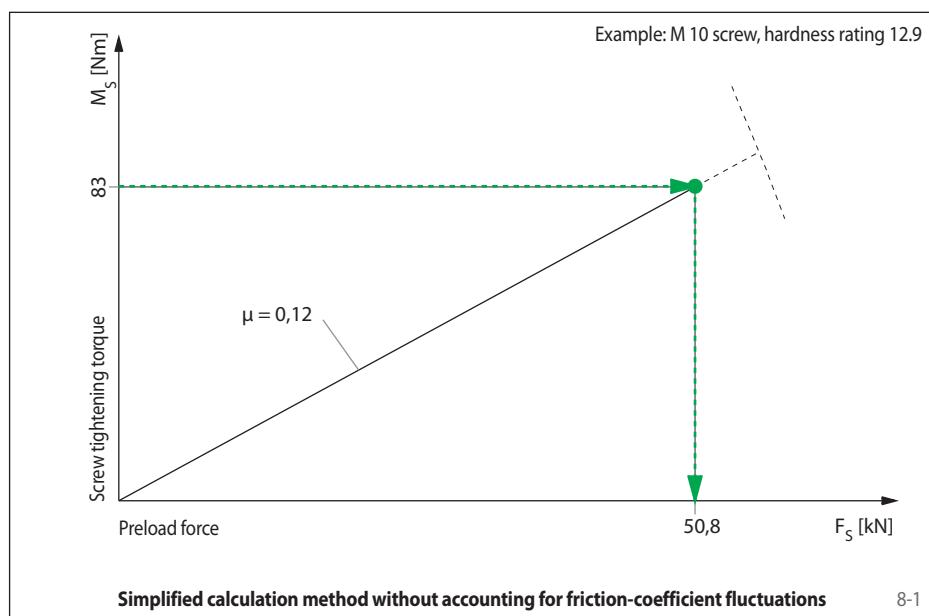

The RINGSPANN calculation method takes into account the friction-coefficient fluctuations which naturally occur in all screw connections. The transmissible torques or axial forces listed in this catalogue are based on friction-coefficient fluctuations in accordance with VDI Guideline 2230 and are minimum values. This ensures a reliable selection of the shaft-hub-connection.

In contrast, torques shown in catalogues issued by various other manufacturers are based on simplified calculation methods. These catalogue values are often comparatively higher, but are subject to the friction-coefficient fluctuations described below and thus do not represent reliable minimum values for customers and users.

In most frictional shaft-hub-connections, the frictional connection is created by torque-controlled tightening of screws. These axially positioned screws are tightened to a specified screw tightening torque. On the basis of the determined preload forces and the transmission ratio of the conical angles, the radial forces between the clamping element and the shaft or hub are calculated by taking into account friction losses. With these radial forces and the friction coefficients between the components, the transmissible torques or axial forces can be calculated.

The determination of the correct actual preload force in a given application is of prime importance. Simple calculation methods are based on an assumed preload force, from which the pressures (and thus the component stress factors) as well as the transmissible torques or axial forces are calculated. The use of such calculation methods is dangerous, as friction-coefficient fluctuations lead to actual preload forces that are higher or lower than assumed. If the actual preload forces are higher, also higher torques may be transmitted, but then the component stress factors are also higher than calculated, which can cause component damage (e.g. to the hub) in extreme cases. In the opposite case, when the preload forces are lower than assumed, the calculated torques or axial forces may not be transmitted. Consequently, the connection slips.

The RINGSPANN calculation method ensures that such errors in the dimensioning of shaft-hub-connections are avoided. This is achieved by using a method that has been tested and proven over many years, according to which the real friction coefficient μ_k in the contact area

under the head of the screw and μ_G in the screw threading lie between 0,12 and 0,14. This conforms to current engineering standards as described in VDI Guidelines 2230. The RINGSPANN method for calculating preload forces is described below using the example of a M 10 screw with a hardness rating of 12.9.

As the actual friction coefficient in a given case is unknown, the screw tightening torque M_s must correspond to the lowest friction coefficient of $\mu = 0,12$ ($M_s = 83$ Nm) according to the RINGSPANN calculation method. If a higher tightening torque is used, the screw could be overloaded.

If the actual friction coefficient is $\mu = 0,14$, then the preload force $F_s = 50,8$ kN will not be achieved with a screw tightening torque of

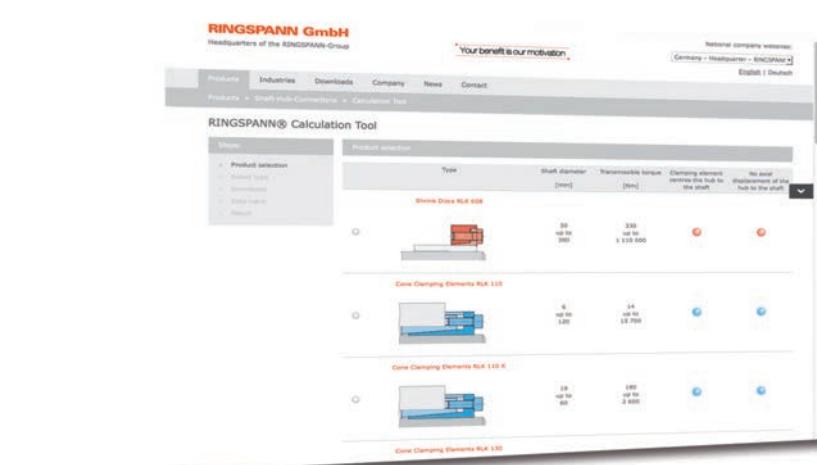

$M_s = 83$ Nm. The preload force will be only $F_s = 44,1$ kN, as shown in figure 8-2. The transmissible torque is then calculated on the basis of a preload force of $F_s = 44,1$ kN, whereas the component stress factors in the hub are calculated on the basis of a preload force of $F_s = 50,8$ kN.

The new RINGSPANN Calculation Tool has been developed to work out the right and time-efficient dimensioning of an optimal shaft-hub-connection.

Whether a Cone Clamping Element or a Shrink Disc, reliable results concerning the necessary hub dimensions and bearing pressures can be determined within a few minutes, as well as the transmissible torques and axial forces for different strengths, torques and numbers of screws. This means that any oversizing or undersizing of the elements can be avoided and a cost-optimised solution found for the application in question.

The use of the tools is intuitively designed and the calculation results are available after just a few steps. A suitable product is first selected based on certain criteria, such as for example the dimensions or the torque to be transmitted. The information related to the selected product is then offered for download as a pdf file as well as the appropriate CAD models.

After that, a customised calculation is carried out and the result is represented in a clear lay-

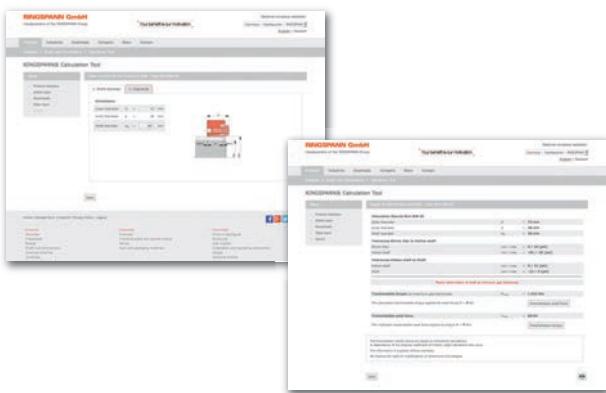

out. Now the torques and axial forces can even be calculated while torque and axial force are transmitted at the same time.

A special function offered by the Calculation Tool is that it checks the torque to be transmitted while taking the axial forces that occur into account, as well as any additional bending moments such as those which can occur in the pulleys of belt conveyor systems.

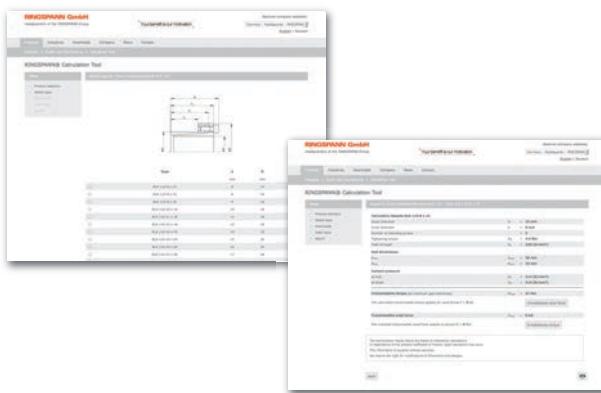

The Calculation Tool is thus a functional tool for reliably checking a RINGSPANN shaft-hub-connection for your application.

You will find an easy-to-follow video tutorial on our website at:
ringspann.com/en/downloads/videos

Shrink Discs

Cone Clamping Elements

Overview of the functions of the Calculation Tool:

- Selection of series and clamping set sizes
- Downloading of relevant product information
- Downloading of CAD models
- Calculation of transmissible torques and axial forces for customized shaft diameters while taking tightening torques, the number of clamping screws, yield strengths, materials and tolerances into account
- Calculation of the transmissible torques and axial forces while at the same time transmitting torque and axial force
- Calculation of transmissible torques with bending moments occurring simultaneously
- Calculation of the required outside diameter of the hub
- Calculation the necessary hub width

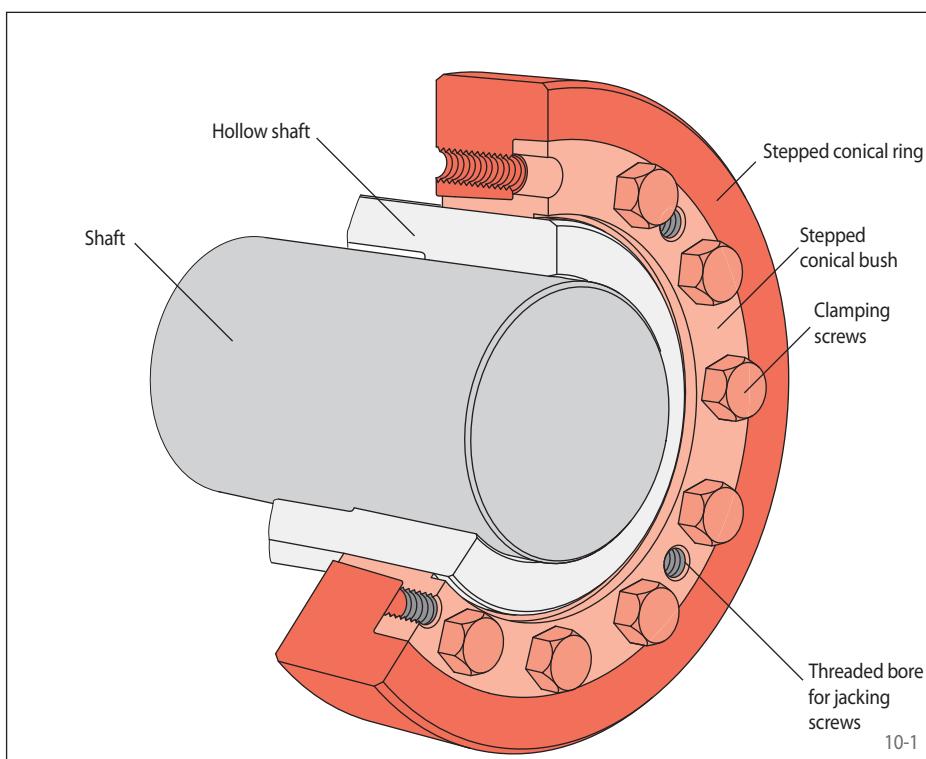

Two-part Shrink Discs

Design and Function

Two-part shrink discs consist of an outer stepped conical ring, and an inner stepped conical bush, as well as a number of clamping screws (see Figure 10-1).

The stepped conical ring is pulled onto the stepped conical bush by tightening the clamping screws. A radial clamping force is generated by the conical surfaces, which is independent of the friction coefficients at the screws and conical surfaces. The radial clamping force presses the hollow shaft onto the shaft and creates a frictional connection at the contact surfaces between the shaft and the hollow shaft. Thereby, torque and/or axial force can be transmitted between the shaft and the hollow shaft.

During the clamping process, the position of the stepped conical bush relative to the hollow shaft remains unchanged. The connection is released by tightening clamping screws in the threaded bores for the jacking screws.

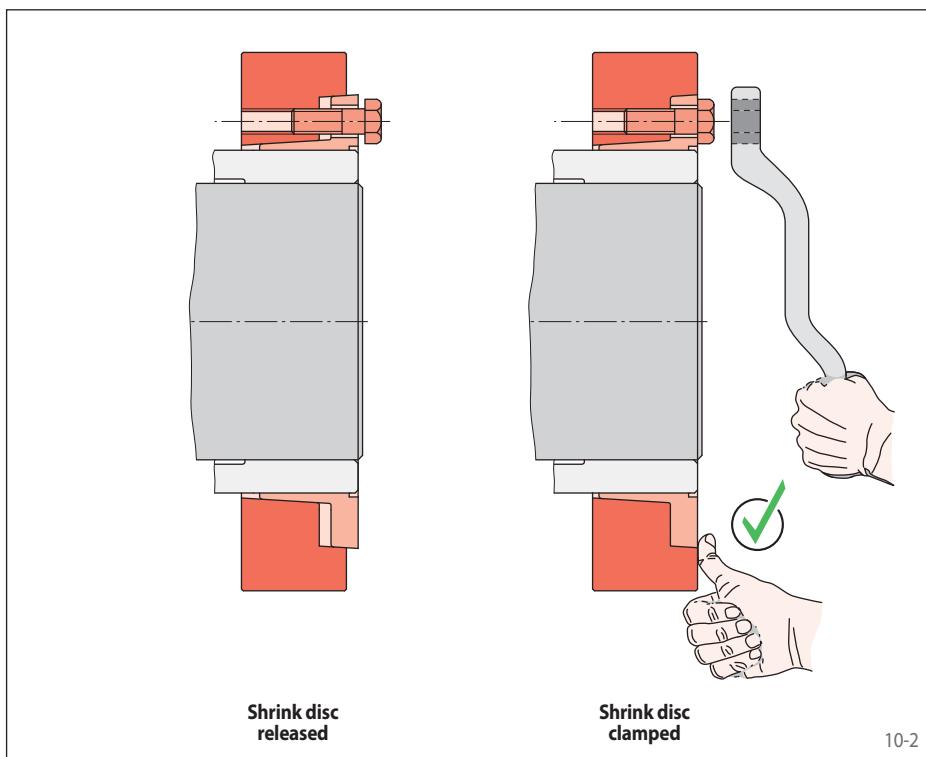

Distance-controlled assembly

The clamping screws are tightened uniformly in a clockwise sequence until the front face of the stepped conical ring is flush with the front face of the stepped conical bush (see figure 10-2).

Once this assembly state is reached, the torque or axial force values shown in the tables can be reliably transmitted between the hollow shaft and the shaft.

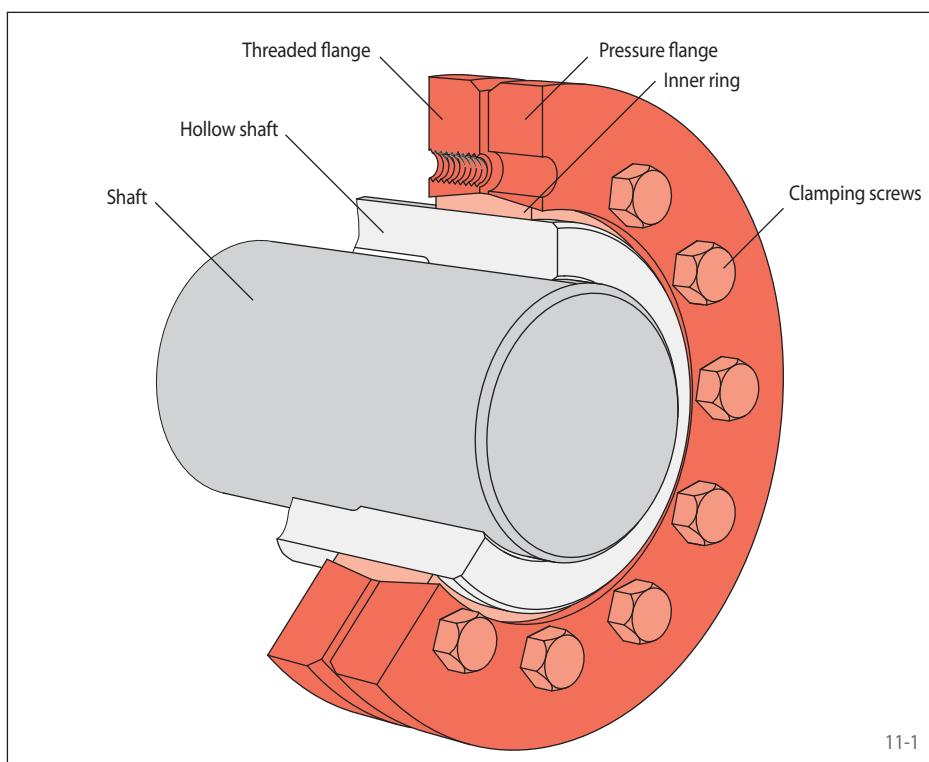

Insufficient or missing lubrication of the conical surfaces as might happen during servicing will make the assembly procedure impossible to complete.

Characteristics

- Easy, quick assembly by tightening clamping screws without a torque wrench
- Modern design with high power density
- Distance-controlled assembly ensures guaranteed transmissible torques
- Enclosed design, therefore impervious to dirt
- True running even at high speeds

Three-part Shrink Discs

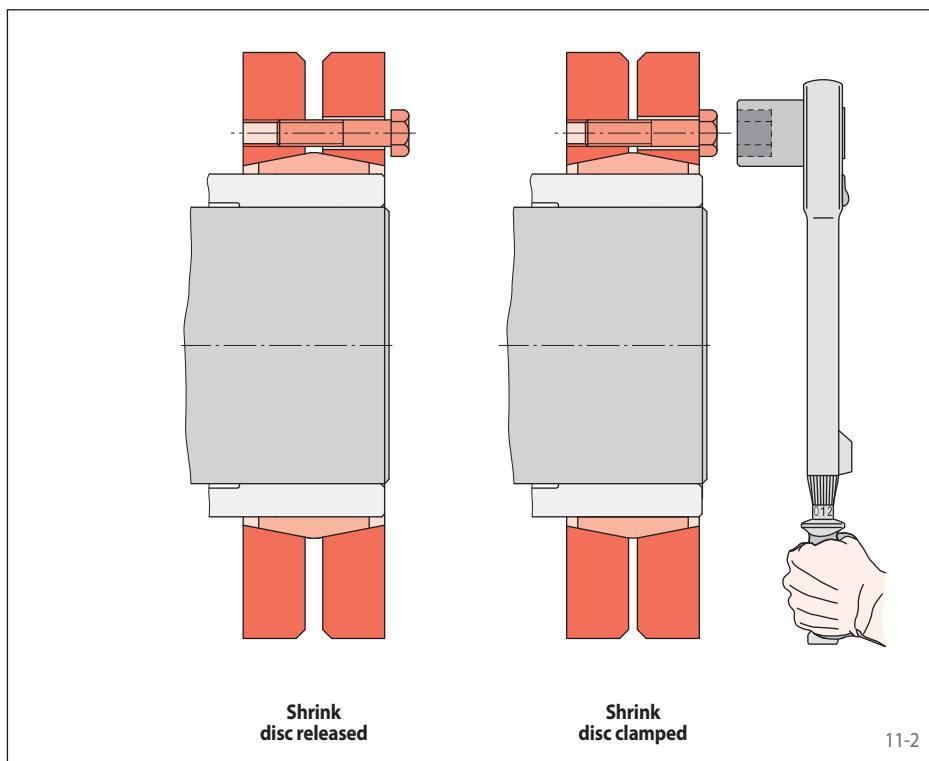

Design and Function

Three-part shrink discs consist of a threaded flange, a pressure flange, a slotted inner ring and a number of clamping screws (see figure 11-1).

The threaded flange and the pressure flange are pulled together over the inner ring by tightening the clamping screws. A radial clamping force is generated by the conical surfaces which is dependent on the friction coefficients at the screws and conical surfaces. The radial clamping force presses the hollow shaft onto the shaft and creates a frictional connection at the contact surfaces between the shaft and the hollow shaft. Thereby, torque and/or axial force can be transmitted between the shaft and the hollow shaft.

During the clamping process, the position of the inner ring relative to the hollow shaft remains unchanged. The connection is released simply by loosening the clamping screws, as the cone angles are self-releasing.

Torque-controlled assembly

The clamping screws are tightened uniformly in a clockwise sequence until the specified torque is achieved (see figure 11-2).

Insufficient or missing lubrication of the conical surfaces as might happen during servicing, results in a reduction of the radial clamping force. The torques or axial forces listed in the tables can no longer be transmitted reliably. This often goes unnoticed as the specified tightening torque was achieved during assembly and the assembly procedure is considered completed.

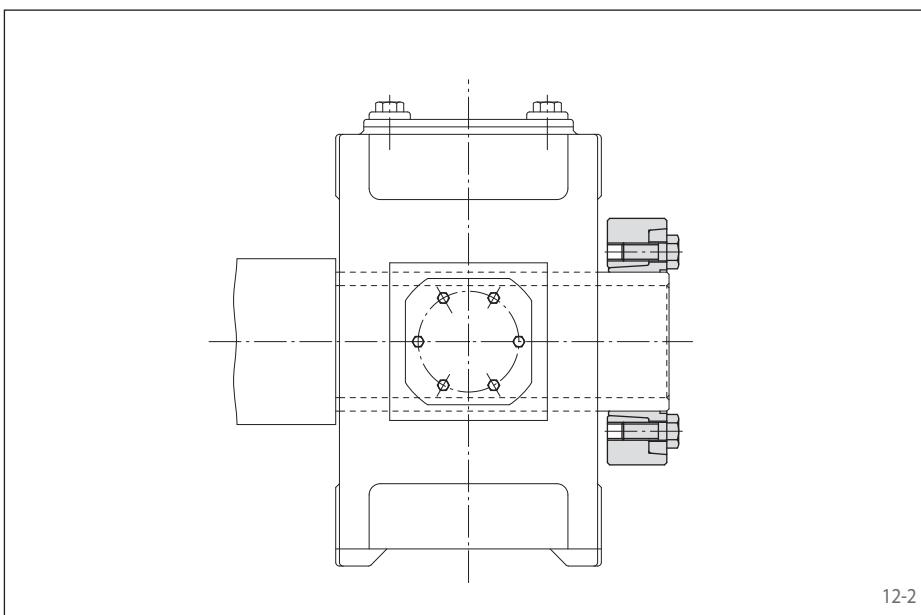

Characteristics

- Tightening of clamping screws with a torque wrench
- Classical design
- Torque-controlled assembly
- Easy disassembly without jacking screws

two-part design
highest torque capacity

12-2

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following three pages are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

d_w mm	\leq mm	Hollow shaft bore ISO	Shaft ISO	Joint clearance min. mm	max. mm
24	30			0	0,034
30	50			0	0,041
50	80			0	0,049
80	120			0	0,057
120	160			0	0,065
160	180			0,014	0,079
180	250			0,015	0,090
250	315			0,017	0,101
315	390			0,018	0,111

Other fits may be selected, provided the joint clearance between the shaft and the hollow shaft remains within the indicated ranges.

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hollow shaft $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hollow shaft:

- Yield strength $R_e \geq 360 \text{ N/mm}^2$
- E-module ca. 206 kN/mm^2

Installation

Please request our installation and operating instructions for Shrink Discs RLK 608.

Features

- Highest torque capacity
- Transmissible torque of 330 Nm up to 4225 000 Nm
- Easy, quick assembly by tightening clamping screws without a torque wrench
- Distance-controlled assembly ensures guaranteed transmissible torques
- Enclosed design, therefore impervious to dirt
- True running even at high speeds
- Centres the hollow shaft or hub to the shaft
- For hollow shafts or hubs with outer diameters of 30 mm up to 620 mm

Application example

Backlash free connection of a hollow-shaft gearbox to a machine shaft with a Shrink Disc RLK 608. The backlash free connection reduces the risk of fretting corrosion. As a result, the connection can be easily disassembled even after long periods of operation.

Simultaneous transmission of torque and axial force

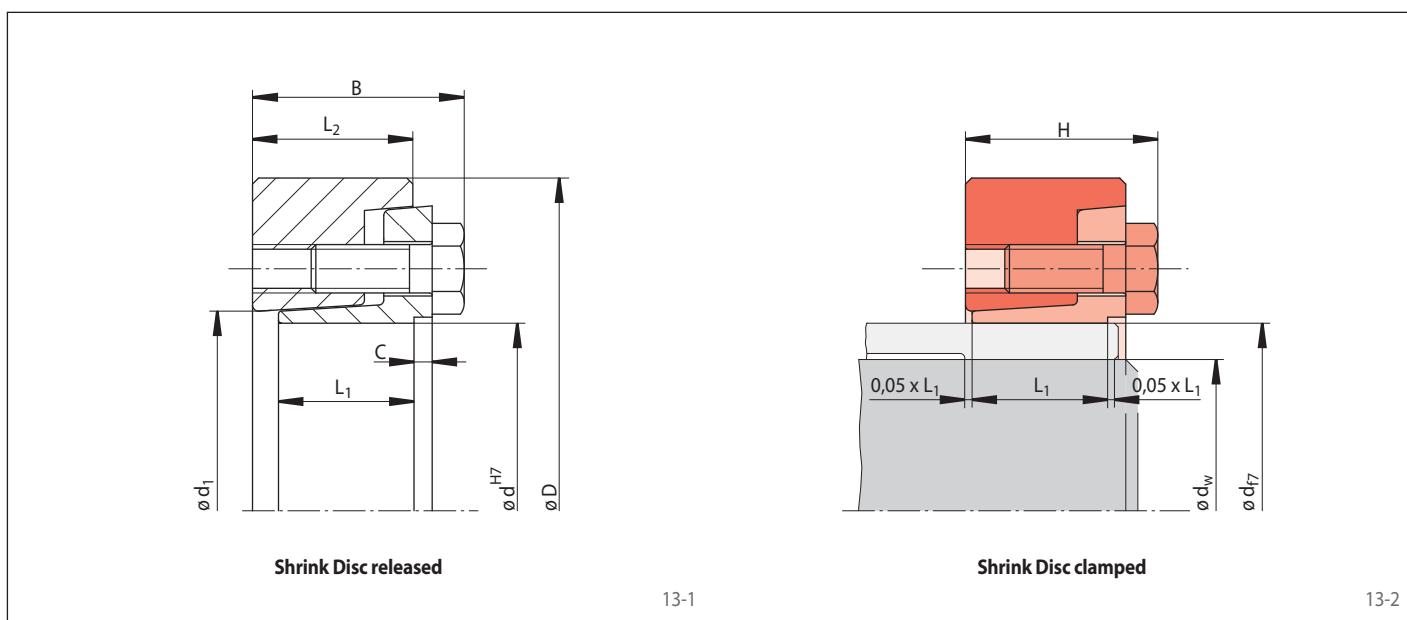

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on page 29.

Example for ordering

Shrink Disc RLK 608 for hollow shaft with an outer diameter $d = 155 \text{ mm}$:

16-2

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following two pages are subject to the following tolerances, surface characteristics and material requirement. Please contact us in the case of deviations.

Tolerances

d_w [mm]	\leq [mm]	Hollow shaft bore ISO	Shaft ISO	Joint clearance min. [mm]	max. [mm]
24	30			0	0,034
30	50			0	0,041
50	80			0	0,049
80	120			0	0,057
120	155			0	0,065

Other fits may be selected, provided the joint clearance between the shaft and the hollow shaft remains within the indicated ranges.

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hollow shaft $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hollow shaft:

- Yield strength $R_e \geq 340 \text{ N/mm}^2$
- E-module ca. 206 kN/mm^2

Installation

Please request our installation and operating instructions for Shrink Discs RLK 606.

Features

- High torque capacity
- Transmissible torque of 165 Nm up to 36 200 Nm
- Easy, quick assembly by tightening clamping screws without a torque wrench
- Distance-controlled assembly ensures guaranteed transmissible torques
- Enclosed design, therefore impervious to dirt
- True running even at high speeds
- Centres the hollow shaft or hub to the shaft
- For hollow shafts or hubs with outer diameters of 24 mm up to 155 mm

Application example

Backlash free connection of a bevel spur gear to a drive shaft of a gearbox with a Shrink Disc RLK 606. The backlash free connection permits extended reversing operations.

Simultaneous transmission of torque and axial force

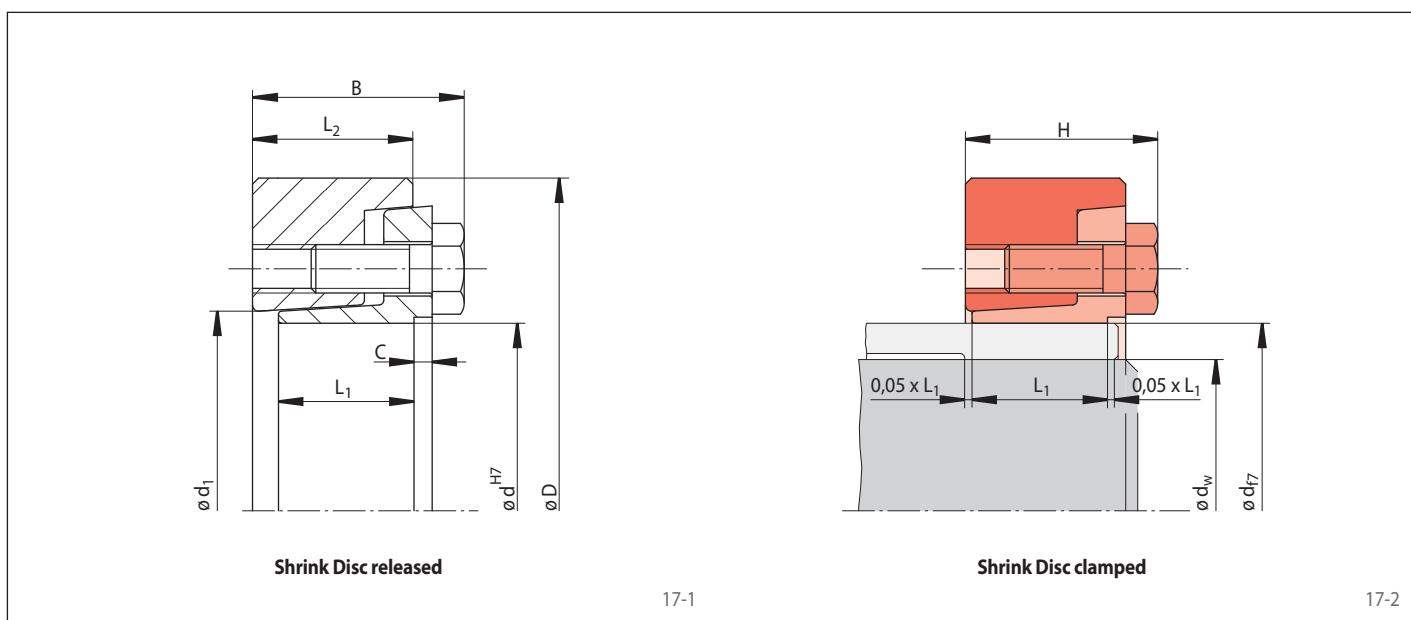

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on page 29.

Example for ordering

Shrink Disc RLK 606 for hollow shaft with an outer diameter $d = 100 \text{ mm}$:

Characteristics

The cost-effective covers made from black plastic (PVC) provide simple contact protection for Shrink Discs RLK 608 and RLK 606 against the screw heads of the rotating Shrink Disc.

Example for ordering

Cover for Shrink Disc RLK 608-100:

20-2

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following three pages are subject to the following tolerances, surface characteristics and material requirement. Please contact us in the case of deviations.

Tolerances

d_w mm	\leq mm	Hollow shaft bore ISO	Shaft ISO	Joint clearance min. mm	max. mm
6	10			-0,007	0,011
10	18	H6	j6	-0,008	0,014
18	30			-0,009	0,017
30	50	H6	h6	0	0,032
50	80	H6	g6	0,029	0,048
80	120			0,012	0,069
120	180			0,014	0,079
180	250			0,015	0,090
250	315			0,017	0,101
315	360			0,018	0,111

Other fits may be selected, provided the joint clearance between the shaft and the hollow shaft remains within the indicated ranges.

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hollow shaft $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hollow shaft:

- Yield strength $R_e \geq 340 \text{ N/mm}^2$
- E-module ca. 206 kN/mm^2

Installation

Please request our installation and operating instructions for Shrink Discs RLK 603.

Features

- High torque capacity
- Transmissible torque of 25 Nm up to 1 460 000 Nm
- Tightening of clamping screws with a torque wrench
- Easy disassembly without jacking screws
- Centres the hollow shaft or hub to the shaft
- For hollow shafts or hubs with outer diameters of 14 mm up to 500 mm

Application example

Backlash free connection of a cardan shaft flange to a machine shaft with a Shrink Disc RLK 603. The backlash free connection reduces the risk of fretting corrosion. As a result, the connection can be easily disassembled even after long periods of operation.

Simultaneous transmission of torque and axial force

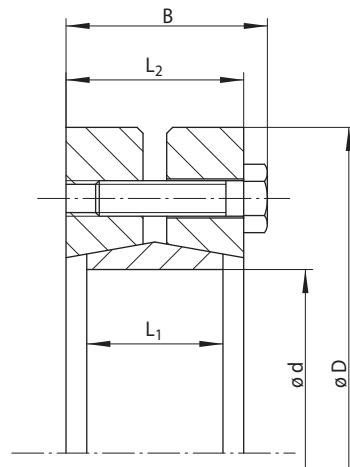

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on page 29.

*The shaft diameters d_w listed in the table are selected examples. For other shaft diameters d_w see the technical specifications on page 29.

**three-part design
highest torque capacity**

Features

- Highest torque capacity
- Transmissible torque of 280 Nm up to 170 600 Nm
- Tightening of clamping screws with a torque wrench
- Easy disassembly without jacking screws
- Centres the hollow shaft or hub to the shaft
- For hollow shafts or hubs with outer diameters of 24 mm up to 190 mm

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

d_w mm	\leq mm	Hollow shaft bore ISO	Shaft ISO	Joint clearance min. mm	max. mm
6	10			0	0,024
10	18			0	0,029
18	30			0	0,034
30	50			0	0,041
50	80			0	0,049
80	120			0	0,057
120	150			0	0,065
150	180			0,014	0,079
180	250			0,015	0,090
250	315			0,017	0,101
315	400			0,018	0,111

Other fits may be selected, provided the joint clearance between the shaft and the hollow shaft remains within the indicated ranges.

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hollow shaft $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hollow shaft:

- Yield strength $R_e \geq 340 \text{ N/mm}^2$
- E-module ca. 206 kN/mm^2

Installation

Please request our installation and operating instructions for Shrink Discs RLK 603 S.

Application example

Backlash free connection of a hollow-shaft to a machine shaft on a flat gear box with a Shrink Disc RLK RLK 603 S. The backlash free connection reduces the risk of fretting corrosion. As a result, the connection can be easily disassembled even after long periods of operation.

Simultaneous transmission of torque and axial force

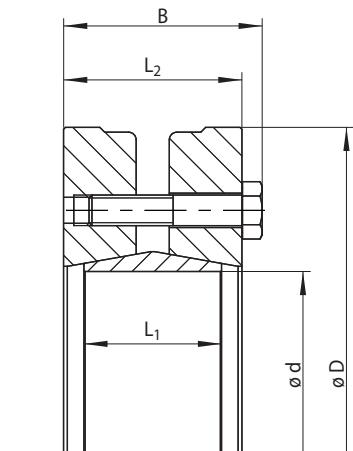

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on page 29.

Example for ordering

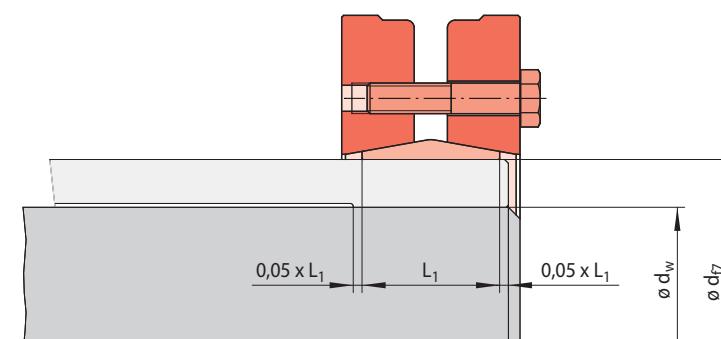

Shrink Disc RLK 603 S for hollow shaft with an outer diameter $d = 95 \text{ mm}$:

26-2

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following two pages are subject to the following tolerances, surface characteristics and material requirement. Please contact us in the case of deviations.

Tolerances

d_w > mm	\leq mm	Hollow shaft bore ISO	Shaft ISO	Joint clearance max. mm
6	10			0,011
11	18	H6	j6	0,014
19	30			0,017
31	50	H6	h6	0,032
51	80	H6	g6	0,048
81	120			0,069
121	180			0,079
181	250			0,090
251	315			0,101
316	400			0,111
401	500			0,123

Other fits may be selected, provided the joint clearance between the shaft and the hollow shaft remains within the indicated ranges.

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hollow shaft $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hollow shaft:

- Yield strength $R_e \geq 300 \text{ N/mm}^2$
- E-module ca. 200 kN/mm^2

Installation

Please request our installation and operating instructions for Shrink Discs RLK 603 K.

Features

- High torque capacity
- Transmissible torque of 170 Nm up to 23 000 Nm
- Tightening of clamping screws with a torque wrench
- Easy disassembly without jacking screws
- Centres the hollow shaft or hub to the shaft
- For hollow shafts or hubs with outer diameters of 24 mm up to 175 mm
- All parts in rust-free stainless steel
- High corrosion resistance
- Screws DIN 931/933 grade A2-70
- Lubricated with H1-registered grease

Application example

Adjustable in the direction of rotation, the Shrink Disc RLK 603 K ensures a backlash free connection of a stirring hook, which is used in a screening system for bakery products, to the gear drive. The use of a stainless steel material permits regular cleaning of the complete unit with cleaning fluids.

Simultaneous transmission of torque and axial force

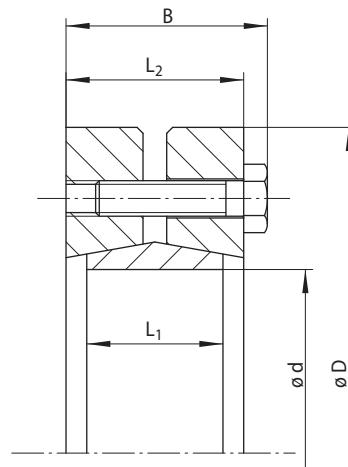

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on page 29.

Example for ordering

Shrink Disc RLK 603 K for hollow shaft with an outer diameter $d = 100 \text{ mm}$:

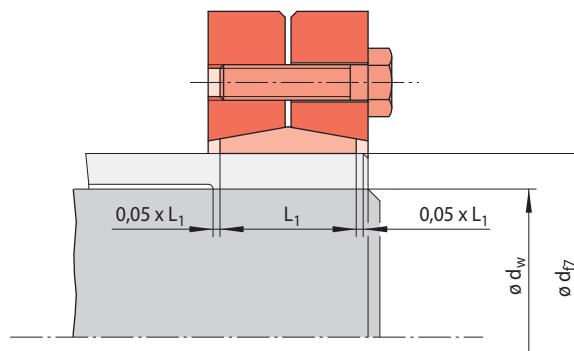

- RLK 603 K-100
Article number 4200-100310-000000

Shaft diameter d_w

The values for the transmissible torques M or axial forces F given in the tables are calculated for exemplary shaft diameters d_w . Values for shaft diameter d_w that fall between the shaft

diameters d_w stated in the table can be determined with sufficient accuracy by interpolation. Please contact us for shaft diameters d_w which are smaller than those

given in the tables. We will gladly calculate the transmissible torques M or axial forces F for you.

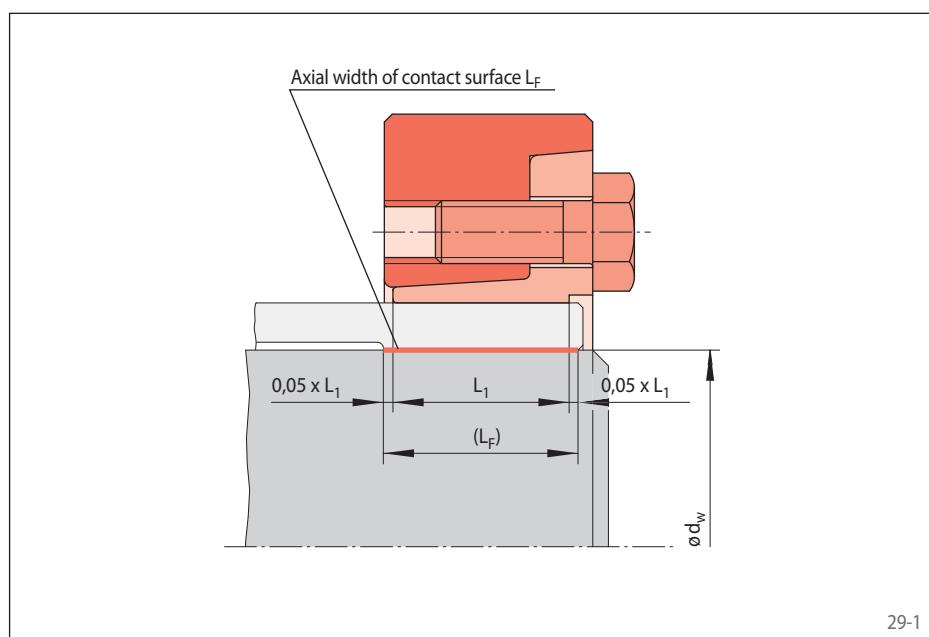

Axial width of contact surface L_F

The transmission of torque or axial force is achieved through the contact surface between shaft and hollow shaft. The pressure created by the Shrink Disc decreases strongly in areas that go beyond the bearing axial width L_1 of the Shrink Disc. In such areas with low pressure, there may be micro movements that allow the formation of harmful fretting corrosion.

The axial width of contact surface L_F should therefore be limited to:

$$L_F \leq 1,1 \cdot L_1$$

For contact surfaces with a width that is smaller than L_1 , there is an increased pressure generated which may damage the shaft and/or hollow shaft or the hub. Please contact us.

29-1

Joint clearance between shaft and hollow shaft

When the joint clearance exceeds the value given in the tables, the transmissible torque or the transmissible axial force decreases. Additionally, the equivalent stress in the hollow shaft increases in this case. Please contact us.

If the joint clearance is lower than indicated, the Shrink Disc, shaft or hollow shaft may be damaged during assembly or the torque listed in the tables can no longer be transmitted. Please contact us.

Formula symbols

d_w = Shaft diameter / inner diameter of hollow shaft according to table [mm]

F = Transmissible axial force according to table [kN]

F_A = Maximum actual application axial force [kN]

F_{red} = Reduced axial force [kN]

L_1 = Load-bearing axial width of Shrink Disc according to table [mm]

L_F = Axial width of contact surface [mm]

M = Transmissible torque according to table [Nm]

M_A = Maximum actual application torque [Nm]

M_{red} = Reduced torque [Nm]

μ = Friction value

Friction value

The values listed in the tables for transmissible torques M or axial forces F assume a friction value of $\mu=0,15$ in the contact surface between shaft and hollow shaft. This value is safely achieved in a dry and degreased steel/steel pairing.

For different friction values, the transmissible torque or axial force will change proportionally.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0$ kN and conversely, the indicated axial forces F apply to torques $M = 0$ Nm. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced compared to the values listed in the tables for M and F.

For a given axial force F_A or torque M_A , the reduced torque M_{red} or axial force F_{red} is calculated as:

$$M_{red} = \sqrt{M^2 - (F_A \cdot \frac{d_w}{2})^2}$$

or

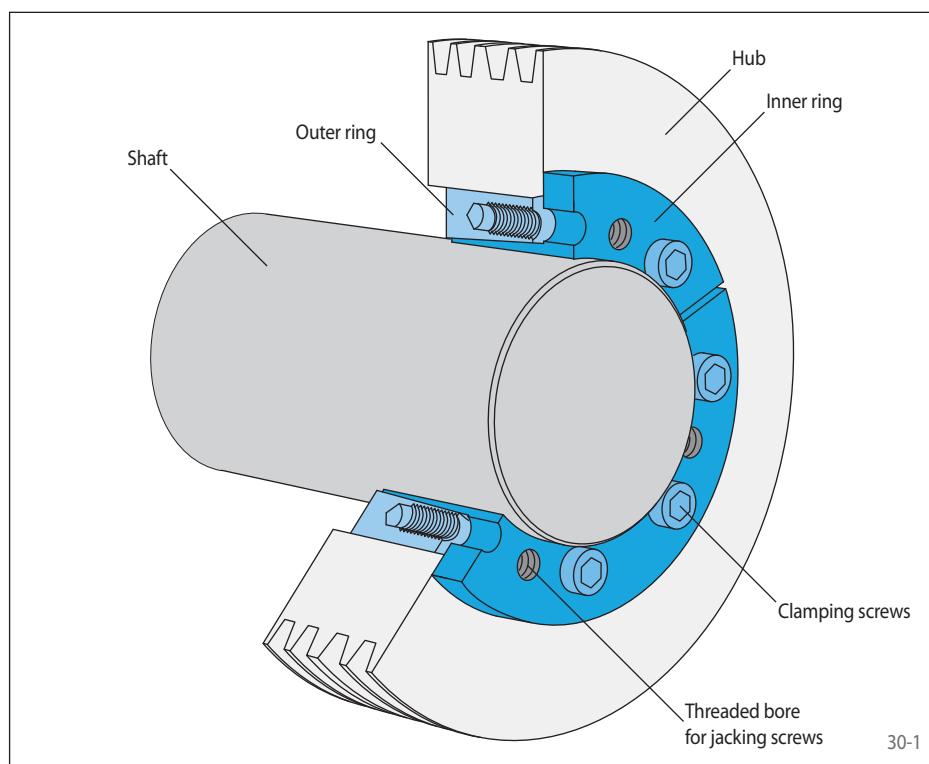

$$F_{red} = \frac{2}{d_w} \sqrt{M^2 - M_A^2}$$

Cone Clamping Elements as shown in figure 30-1 consist of an outer ring with inside cone and an inner ring with outside cone as well as a number of clamping screws.

The outer ring is pulled onto the inner ring by tightening the clamping screws. Radial clamping forces are generated by the conical surfaces which are dependent on the torques of the clamping screws, the cone angle and the friction coefficients at the screws and conical surfaces.

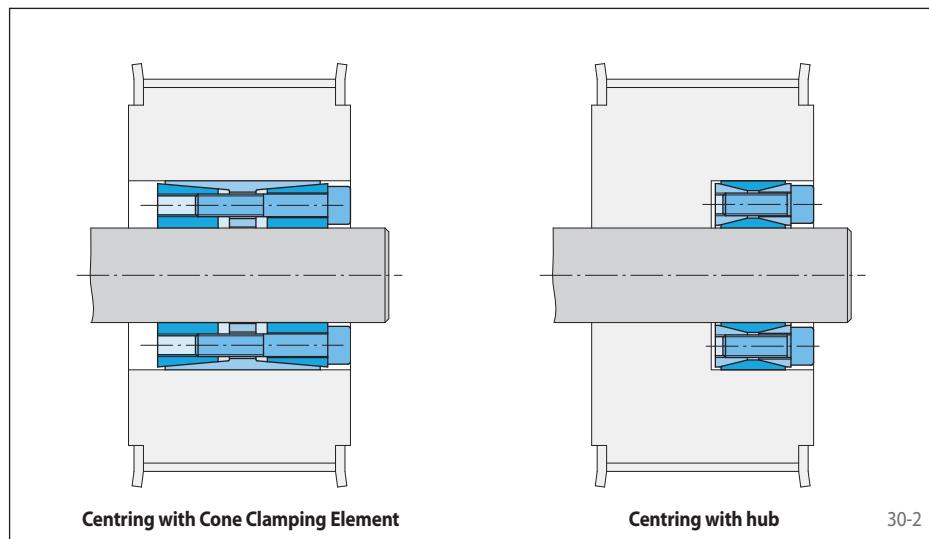

The radial clamping forces press the outer ring into the hub bore and the inner ring onto the shaft and create a frictional connection at the respective contact surfaces. In this way, torque and/or axial force can be transmitted between the shaft and the hub.

In the configuration shown in the illustration, the connection is released by turning some of the clamping screws into the threaded bores for the jacking screws. This presses off the outer ring.

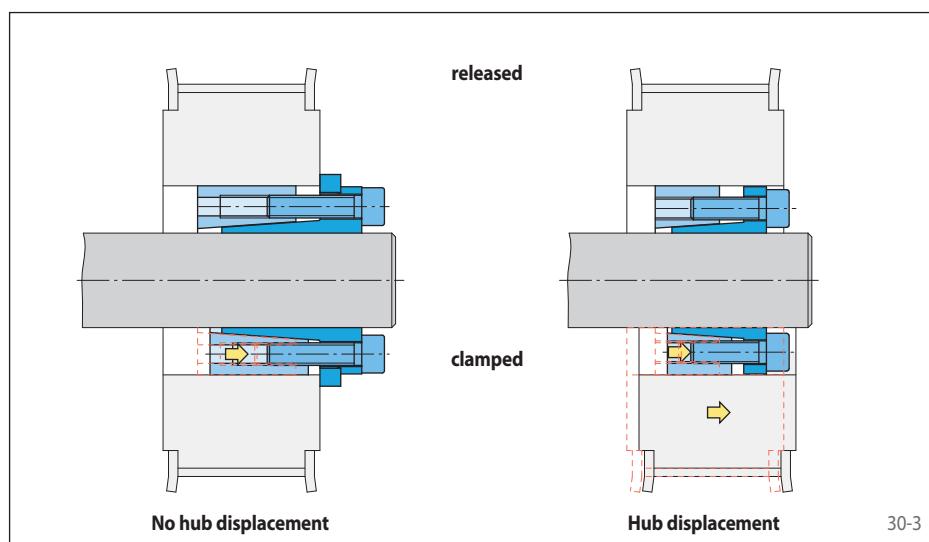

Centring the hub to the shaft

As a rule, a true running accuracy of the hub to the shaft of 0,02 to 0,04 mm can be achieved with Cone Clamping Elements. Exceptions are the Cone Clamping Elements of the series RLK 200 and RLK 300. With these series the hub must be centred to the shaft in accordance with the specific requirements of the application.

No axial displacement of the hub relative to the shaft during clamping

The overview on pages 4 and 5 shows the series for which no axial displacement of the hub relative to the shaft is created during the clamping procedure. This is ensured, for example, by a fixed hub backstop point on the collar of the inner ring. For all other series, the clamping procedure (tightening the clamping screws and pulling the outer ring onto the inner ring) involves an axial hub displacement.

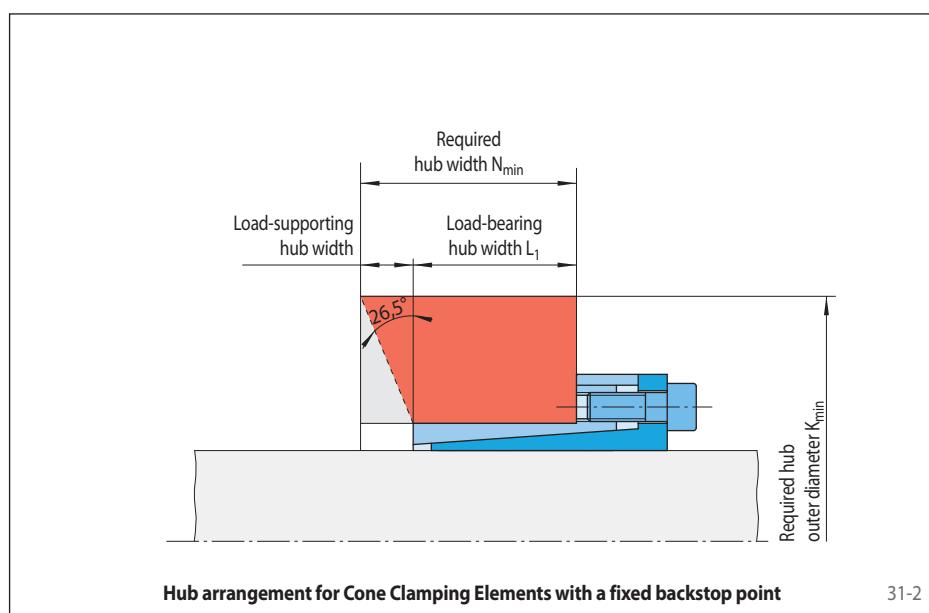

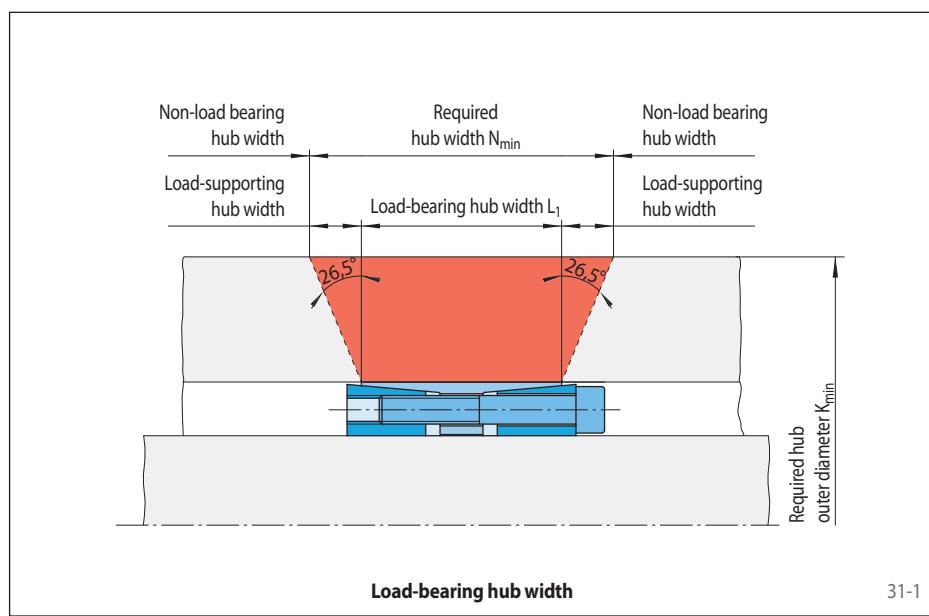

Frictional shaft-hub-connections with Cone Clamping Elements create very high radial clamping forces. This requires a hardness analysis of shaft and hub. For this, the Cone Clamping Element tables list the maximum pressures P_w in the contact surface at the shaft and the maximum pressures P_N in the contact surface at the hub.

The contact pressure P_w leads to radial stress in the shaft that is usually not critical for steel shafts. There is always a tangential stress σ_t in the hub, and for thin-walled hubs it may be a multiple of the initiated pressure P_N . The amount of the actual tangential stress depends on the hub width, the hub outer diameter and the pressure. Calculation of required hub width N_{min} takes into account the fact that hub pressure P_N is transmitted by load-bearing hub width L_1 and taken up beyond it in an angle of approximately $26,5^\circ$ (see figure 31-1).

For the different Cone Clamping Element series, the tables list the required hub width N_{min} and the required hub outer diameter K_{min} for three exemplary yield strengths R_e of the hub. Thereby, the hub is to be arranged as seen in figure 31-2 for Cone Clamping Elements with a fixed backstop point.

For any deviating hub arrangement and/or lower yield strengths R_e of the hub material, the shaft-hub-connection must be verified according to the technical points on pages 72 and 73.

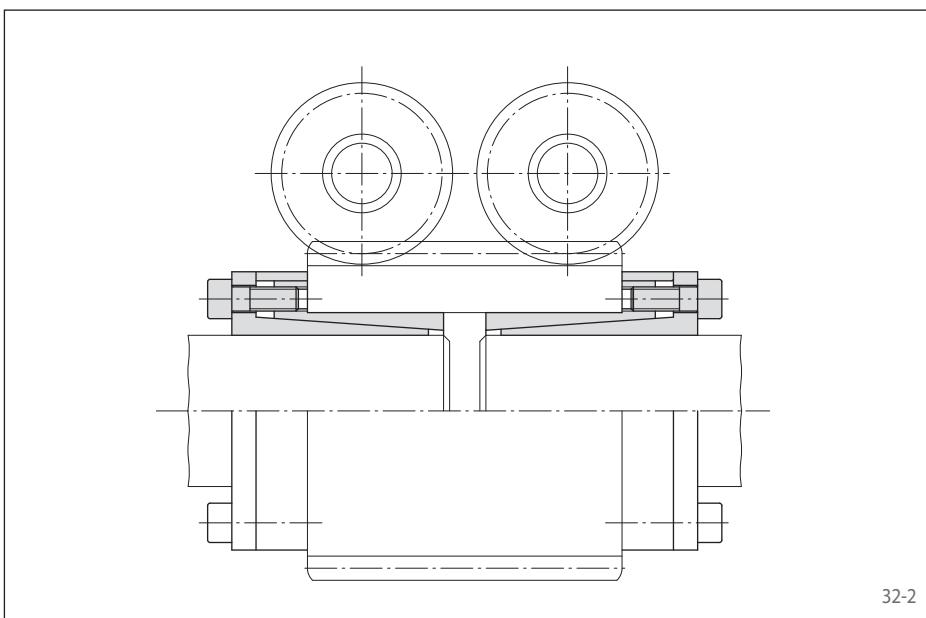

centres the hub to the shaft
radial flat height

Features

- Centres the shaft to the hub
- High transmissible torques
- Radial flat height is particularly suitable for small hub outer diameters
- No axial displacement between hub and shaft during clamping procedure due to fixed backstop point
- Transmissible torque of 17 Nm up to 18000 Nm
- For shaft diameters between 6 mm and 120 mm

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 110.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

Cone Clamping Element RLK 110 for shaft diameter d = 100 mm:

- RLK 110, size 100 x 125
Article number 4206-100001-000000

Cone Clamping Elements RLK 110 K

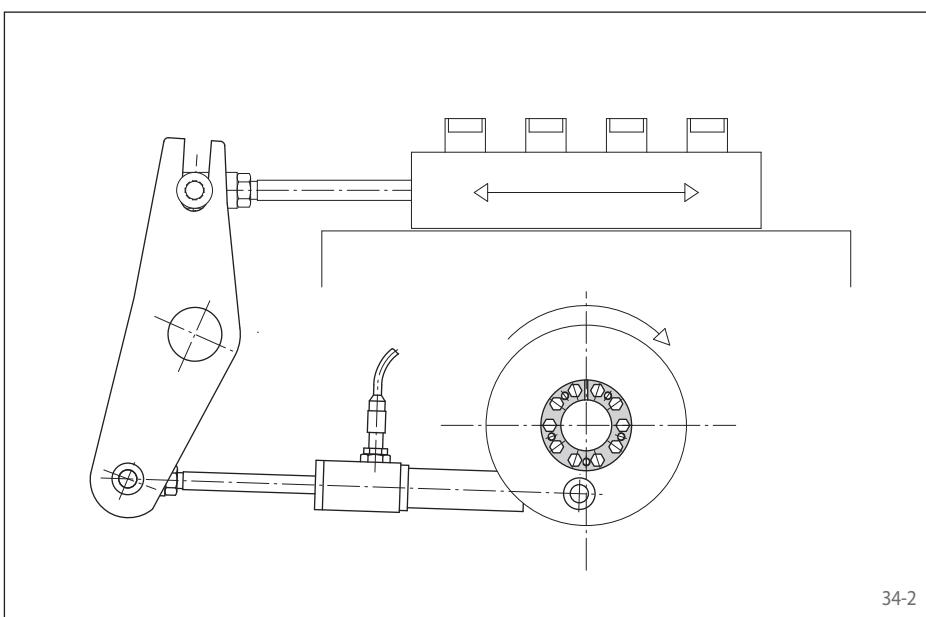

RINGSPANN®

centres the hub to the shaft
corrosion protected

Features

- Centres the shaft to the hub
- All parts 35 µm chemically nickel-coated for high corrosion resistance pursuant to DIN 50021 (neutral salt spray test)
- High transmissible torques
- Radial flat height is particularly suitable for small hub outer diameters
- No axial displacement between hub and shaft during clamping procedure due to fixed backstop point
- Transmissible torque of 190 Nm up to 2800 Nm
- For shaft diameters between 19 mm and 60 mm

Transmissible torques and axial forces

Cone Clamping Elements RLK 130

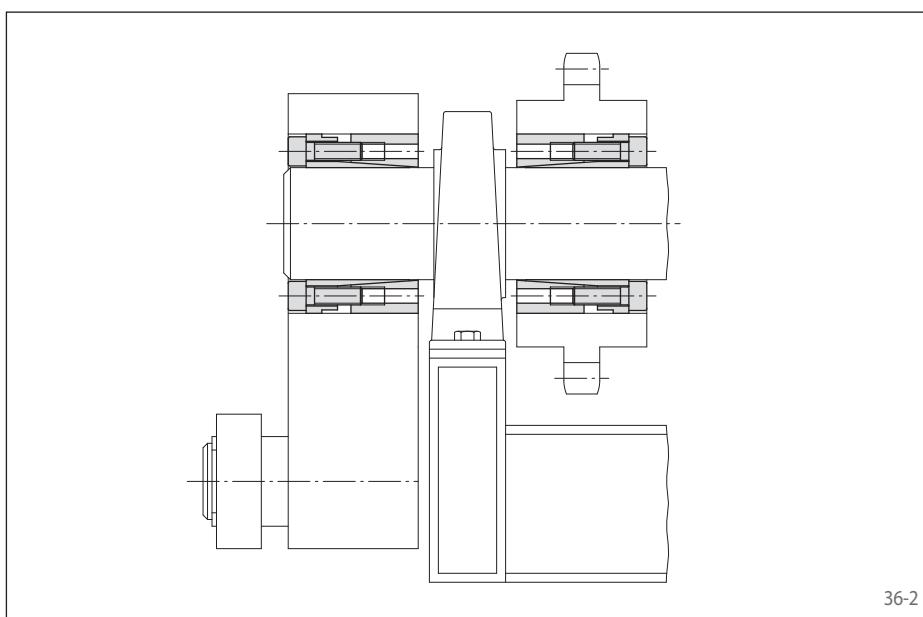

RINGSPANN®

centres the hub to the shaft
very high transmissible torques

Features

- Centres the shaft to the hub
- Very high transmissible torques
- Transmissible torque of 580 Nm up to 70 000 Nm
- For shaft diameters between 20 mm and 180 mm

Application example

Backlash free connection of an eccentric lift unit and a sprocket to the drive shaft of a hoisting device using Cone Clamping Elements RLK 130. The eccentric force applied to the eccentric lift unit results in the Cone Clamping Element transmitting not only torque, but also forces and bending moments.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Cone Clamping Elements RLK 131

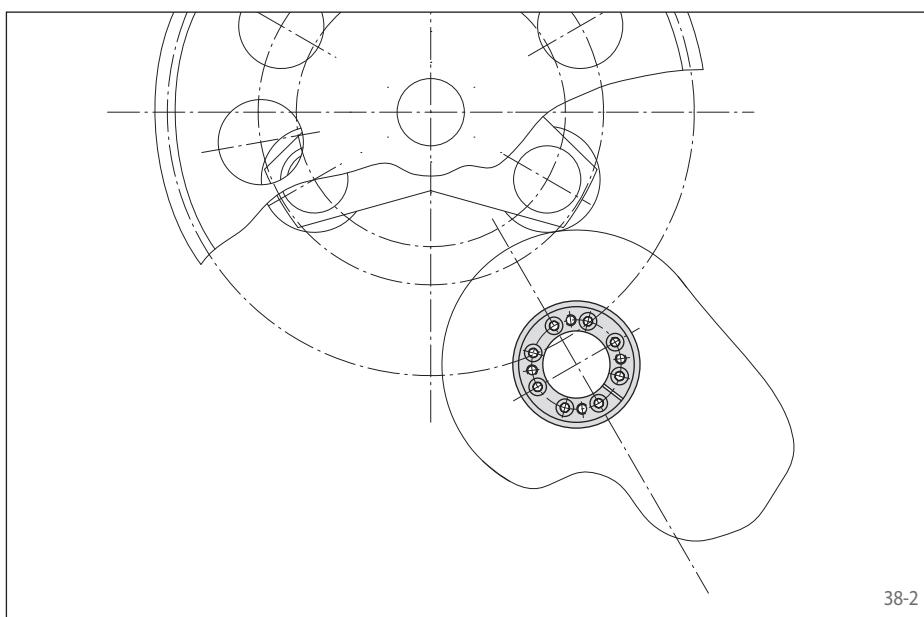

RINGSPANN®

centres the hub to the shaft
no axial displacement

Features

- Centres the shaft to the hub
- No axial displacement between hub and shaft during clamping procedure due to fixed backstop point
- Transmissible torque of 350 Nm up to 43 000 Nm
- For shaft diameters between 20 mm and 180 mm

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 131.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

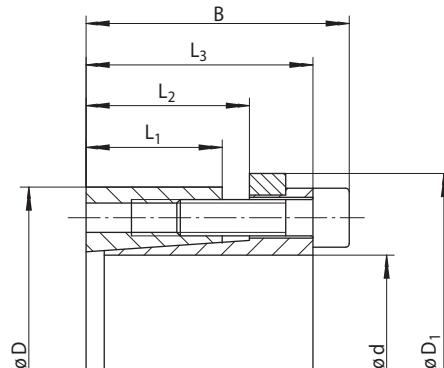

Cone Clamping Element RLK 131 for shaft diameter d = 100 mm:

- RLK 131, size 100 x 145
Article number 4204-100101-000000

centres the hub to the shaft
short axial width

Features

- Centres the shaft to the hub
- High transmissible torques
- Short axial width
- Transmissible torque of 580 Nm up to 83 500 Nm
- For shaft diameters between 20 mm and 200 mm

Application example

Backlash free connection of a belt pulley to the drive shaft with a Cone Clamping Element RLK 132. The Cone Clamping Element also centres the pulley to the shaft. The compact Cone Clamping Element is a cost-efficient solution especially for applications with low space requirements.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 132.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Cone Clamping Elements RLK 133

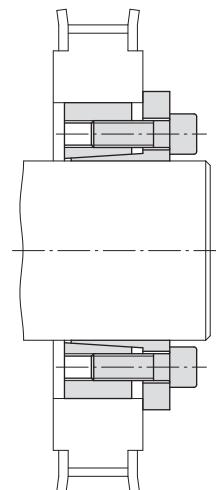

RINGSPANN®

centres the hub to the shaft
short axial width with fixed backstop point

Features

- Centres the shaft to the hub
- Short axial width
- No axial displacement between hub and shaft during clamping procedure due to fixed backstop point
- Transmissible torque of 350 Nm up to 51 500 Nm
- For shaft diameters between 20 mm and 200 mm

42-2

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 133.

Application example

Backlash free connection of a timing belt pulley to the drive shaft with a Cone Clamping Element RLK 133. Due to the fixed backstop point, the timing belt pulley is not displaced axially during clamping. The Cone Clamping Element also centres the timing belt pulley to the shaft. The compact Cone Clamping Element is a cost-efficient solution especially for applications with low space requirements.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

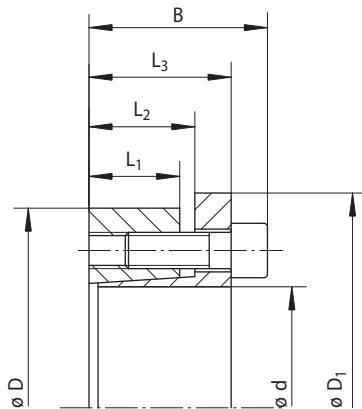

Cone Clamping Element RLK 133 for shaft diameter d = 100 mm:

- RLK 133, size 100 x 145
Article number 4204-100301-000000

Cone Clamping Elements RLK 133 TC

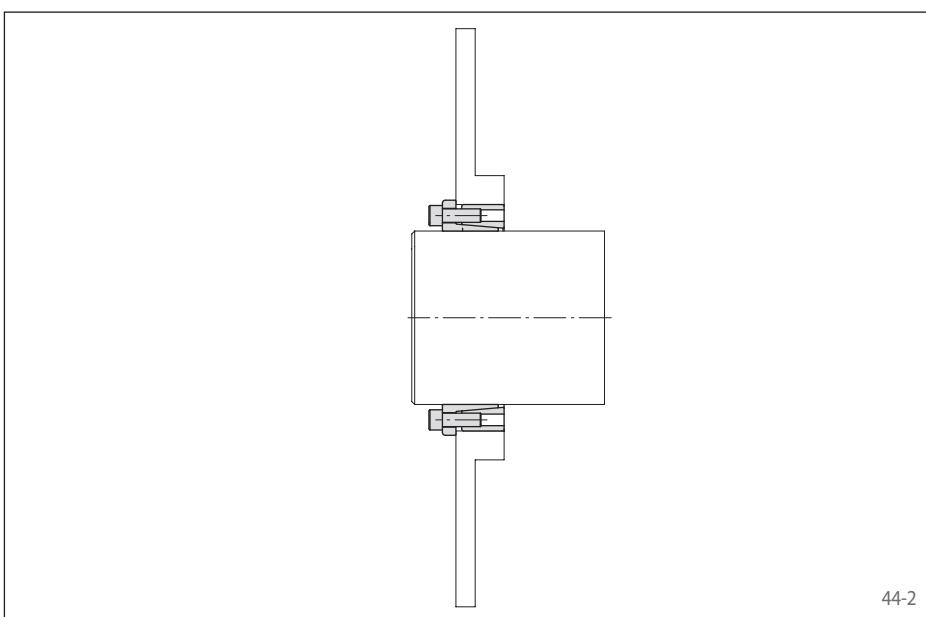

RINGSPANN®

Premium quality for high centering accuracy
Can be assembled multiple times

Features

- Centres the shaft to the hub. Double slot for high centering accuracy.
- Can be assembled multiple times
- Highest transmissible torque
- Short axial width
- No axial displacement between hub and shaft during clamping procedure due to fixed backstop point
- Highest machining quality
- Transmissible torque of 4 800 Nm up to 56 750 Nm
- For shaft diameters between 70 mm and 520 mm

Application example

Backlash free connection of a brake disc to the drive shaft with a Cone Clamping Element RLK 133 TC. Due to the fixed backstop point, the brake disc is not displaced axially during clamping. The Cone Clamping Element also centres the brake disc to the shaft. The compact Cone Clamping Element is a cost-efficient solution especially for applications with low space requirements.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 133 TC.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Cone Clamping Elements RLK 136 TC

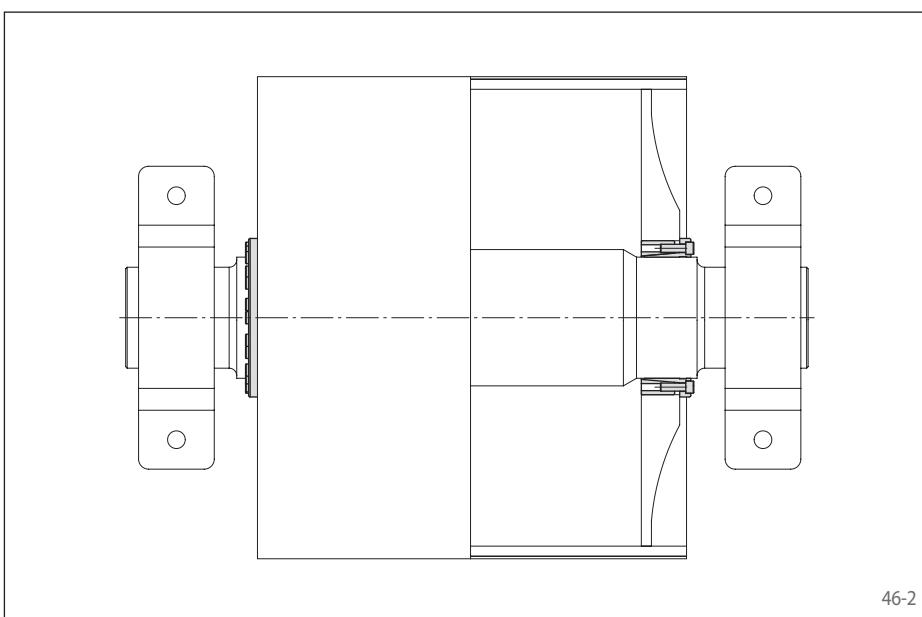

RINGSPANN®

Premium quality for high centering accuracy
Can be assembled multiple times

Features

- Centres the shaft to the hub. Double slot for high centering accuracy.
- Can be assembled multiple times
- Highest transmissible torque
- Short axial width
- No axial displacement between hub and shaft during clamping procedure due to fixed backstop point
- Highest machining quality
- Transmissible torque of 6 700 Nm up to 994 500 Nm
- For shaft diameters between 70 mm and 600 mm

Application example

Backlash free attachment of a belt drum to the drive shaft of a conveyor belt with an Cone Clamping Element RLK 136 TC. The Cone Clamping Element centres the belt drum on the drive shaft. As no axial shift occurs during the clamping process, the axial position of the belt drum in relation to the drive shaft remains unchanged.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 136 TC.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

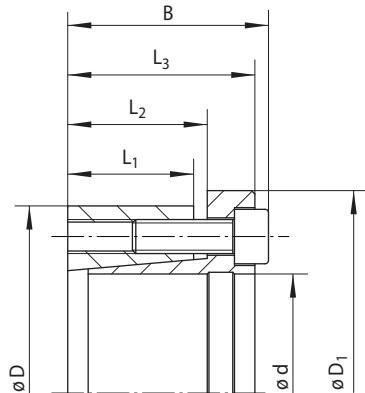

Cone Clamping Element RLK 136 TC for shaft diameter d = 100 mm:

- RLK 136 TC, size 100 x 150
Article number 4204-100601-TC0000

**easy to release
compact design**

Features

- Easy to release
- Compact design
- No axial displacement between hub and shaft during clamping procedure
- Extended tolerances for hub and shaft
- Transmissible torque of 300 Nm up to 428 500 Nm
- For shaft diameters between 20 mm and 400 mm

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h9 for shaft diameter d
- H9 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 200.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

Cone Clamping Element RLK 200 for shaft diameter d = 100 mm:

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore:
 $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 250.

Features

- Centres the hub to the shaft
- Radial flat height is particularly suitable for small hub outer diameters
- Quick assembly by central groove nut
- Easy to release
- Transmissible torque of 38 Nm up to 1 050 Nm
- For shaft diameters between 15 mm and 70 mm

Application example

Backlash free connection of a drive wheel to a shaft with a Cone Clamping Element RLK 250. The central groove nut leads to a uniform displacement of the cone ring during clamping and thus achieves a centring that is sufficient for lower requirements. The central groove nut and the self-releasing cone ensure quick disassembly. Thus, a worn drive wheel can be replaced with the shortest of downtimes.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces F = 0 kN and conversely, the indicated axial forces F apply to torques M = 0 Nm. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

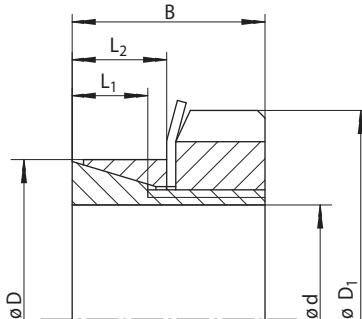

Cone Clamping Element RLK 250 for shaft diameter d = 50 mm:

- RLK 250, size 50 x 62
Article number 4202-050001-000000

If the hub cannot be freely moved to the left, e.g. due to a shaft shoulder, the values for M, F, P_W and P_N are reduced by 37%. In this case, the required hub outer diameter K_{min} and the required hub width N_{min} may be lower than indicated.

Cone Clamping Elements RLK 250 L

RINGSPANN®

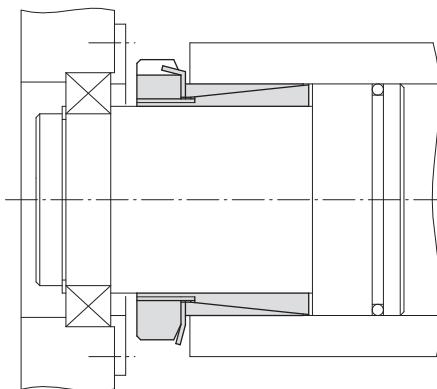

centres the hub to the shaft
quick assembly

52-1

Features

- Centres the hub to the shaft
- Radial flat height is particularly suitable for small hub outer diameters
- Quick assembly by central groove nut
- Transmissible torque of 74 Nm up to 1 500 Nm
- For shaft diameters between 15 mm and 70 mm

52-2

Application example

Backlash free connection of a hollow shaft with a Cone Clamping Element RLK 250 L. The Cone Clamping Element centres the hollow shaft on the shaft. Due to the flat radial height of the Cone Clamping Element, the hollow shaft can be designed thin walled.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 250 L.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

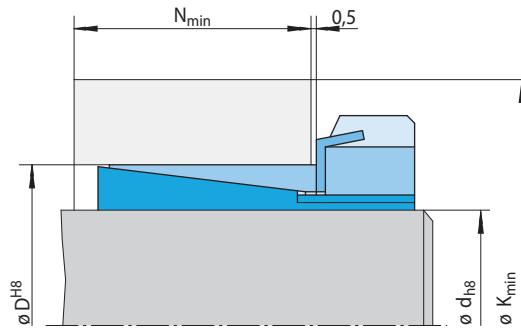

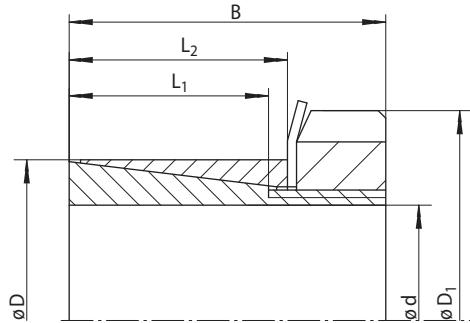

Cone Clamping Element RLK 250 L for shaft diameter $d = 50 \text{ mm}$:

- RLK 250 L, size 50 x 60
Article number 4202-050002-000000

If the hub cannot be freely moved to the left, e.g. due to a shaft shoulder, the values for M, F, P_w and P_N are reduced by 37%. In this case, the required hub outer diameter K_{min} and the required hub width N_{min} may be lower than indicated.

for individual clamping connections

54-1

54-2

Transmissible torques and axial forces

The transmissible torques or axial forces listed on pages 56 and 57 are subject to the following tolerances, surface characteristics, materials and preload force requirement. Please contact us in the case of deviations.

Tolerances

d mm	\leq mm	Hub bore ISO	Shaft ISO
10	40	H7	h6
40	200	H8	h8

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hollow shaft $R_z = 4 \dots 10 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Preload force

The preload force is achieved by the clamping screws provided by the customer. The preload force E_1 or E_2 stated in the table may be increased or decreased according to the technical notes on page 72.

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 300.

Features

- For individual clamping connections
- Compact design
- Transmissible torque of 7,3 Nm up to 27 393 Nm
- For shaft diameters between 10 mm and 200 mm

Application example

Backlash free connection of two V-belt pulleys with two Cone Clamping Elements RLK 300 each. In this assembly, the screw force is used on both sides. By this, both packages with two Cone Clamping Elements each are charged with the preload force. Due to the double arrangement of the Cone Clamping Elements, the transmissible torque is increased. Because of the recessed hub, separate pressure flanges are not required. This makes the solution very cost-effective.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

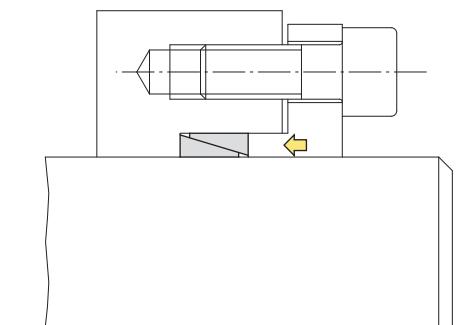

Cone Clamping Element RLK 300 for shaft diameter $d = 50 \text{ mm}$:

- RLK 300, size 50 x 57
Article number 4203-050001-000000

for individual clamping connections

Installation case 1

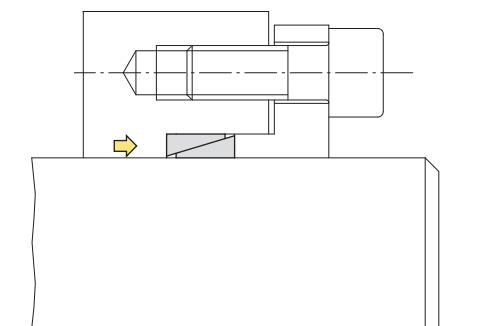

The adjusted axial position of the hub is not changed during clamping. The preload force E_1 must be provided for.

55-1

Installation case 2

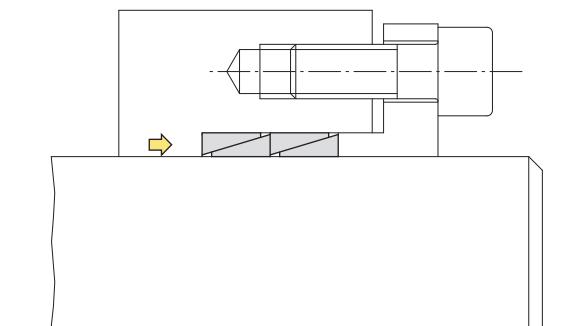

During clamping, the hub is displaced slightly to the right compared to the shaft. The preload force E_2 must be provided for. The connection can easily be released when the Cone Clamping Element is assembled according to figure 55-2.

55-2

Double Arrangement

A double arrangement of two Cone Clamping Elements must be built according to installation case 2. The transmissible torque or axial force are not doubled compared to the values for M or F listed in the tables but are increased by 55%. The preload force E_1 must be provided for. The hub stress σ_V must be verified (page 73).

Cone Clamping Elements RLK 350

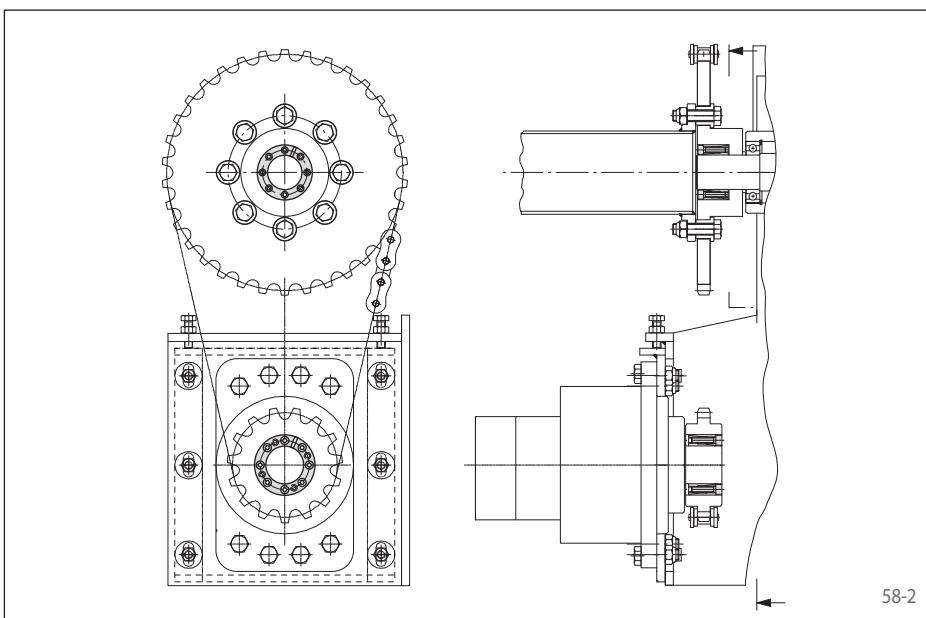

RINGSPANN®

centres the hub to the shaft
for small shaft diameters

Features

- Centres the hub to the shaft
- Transmissible torque of 7,2 Nm up to 2 200 Nm
- For shaft diameters between 5 mm and 50 mm

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore:
 $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

If the hub cannot be freely moved the values for M, F, P_W and P_N are reduced by 37%. K_{\min} can be decreased. See the technical notes on page 73.

Please request our installation and operating instructions for Cone Clamping Elements RLK 350.

Application example

Backlash free connection of sprocket wheels to shafts in the drive of an industrial door with Cone Clamping Elements RLK 350. The Cone Clamping Elements centre the sprocket wheels on the shaft. The sprocket wheels can be easily aligned in axial and circumferential directions during assembly.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces F = 0 kN and conversely, the indicated axial forces F apply to torques M = 0 Nm. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

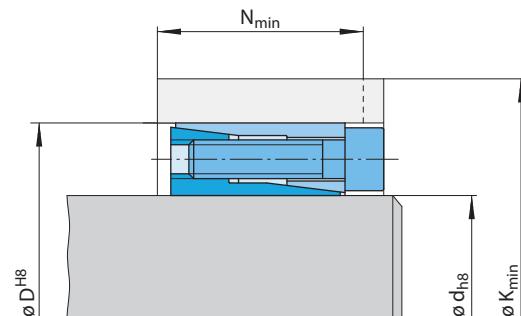

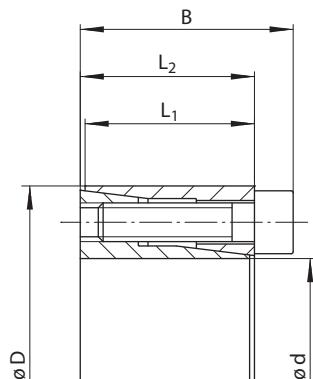

Cone Clamping Element RLK 350 for shaft diameter d = 50 mm:

- RLK 350, size 50 x 80
Article number 4208-050001-000000

Cone Clamping Elements RLK 402

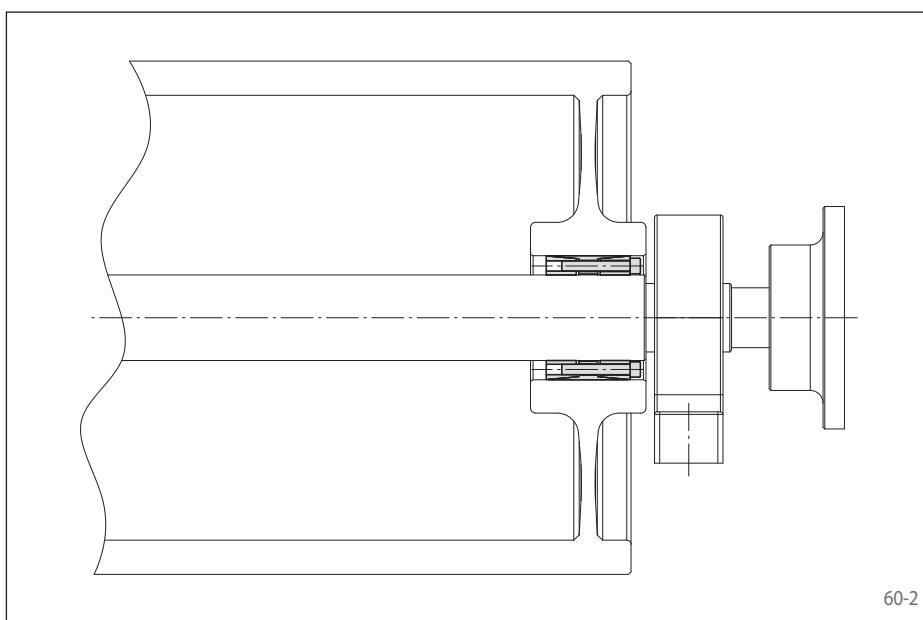

RINGSPANN®

centres the hub to the shaft
highest transmissible torques

Features

- Centres the hub to the shaft
- Highest transmissible torques
- For heavy duty applications
- No axial displacement between hub and shaft during clamping procedure
- Transmissible torque of 840 Nm up to 141 500 Nm
- For shaft diameters between 25 mm and 300 mm

Application example

Backlash free attachment of a belt drum to the drive shaft of a conveyor belt with a Cone Clamping Element RLK 402 TC. The Cone Clamping Element can be used to transmit all acting loads of a driven belt drum. It centres the belt drum on the drive shaft. As no axial shift occurs during the clamping process, the axial position of the belt drum in relation to the drive shaft remains unchanged.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 402.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Cone Clamping Elements RLK 402 TC

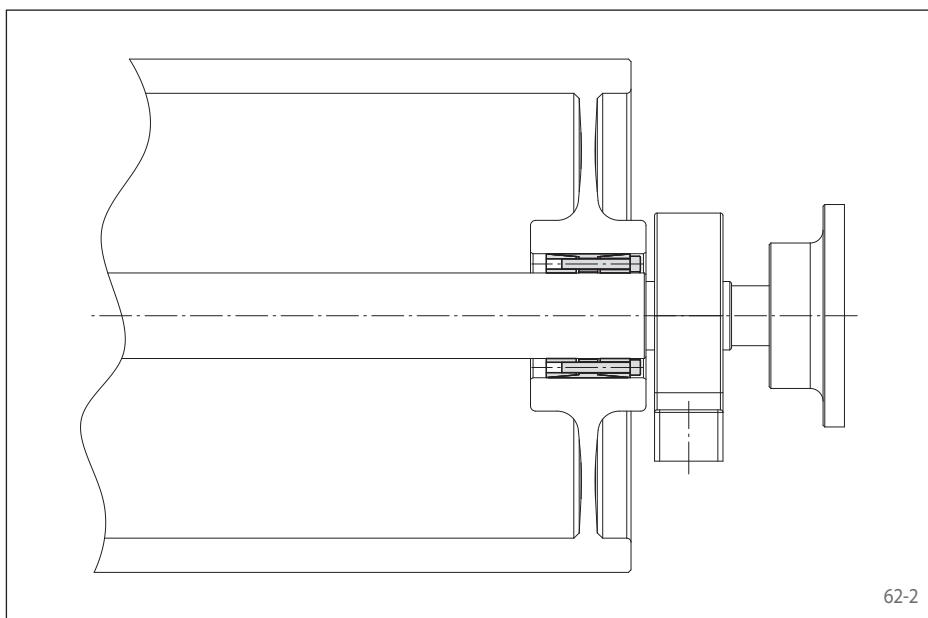

RINGSPANN®

Premium quality for high centering accuracy
Can be assembled multiple times

Features

- Centres the shaft to the hub. Double slot for high centering accuracy.
- Can be assembled multiple times
- Highest transmissible torque
- For heavy duty applications
- No axial displacement between hub and shaft during clamping procedure
- Highest machining quality
- Transmissible torque of 11 200 Nm up to 1 701 000 Nm
- For shaft diameters between 70 mm and 600 mm

Application example

Backlash free attachment of a belt drum to the drive shaft of a conveyor belt with a Cone Clamping Element RLK 402 TC. The Cone Clamping Element can be used to transmit all acting loads of a driven belt drum. It centres the belt drum on the drive shaft. As no axial shift occurs during the clamping process, the axial position of the belt drum in relation to the drive shaft remains unchanged.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 402 TC.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

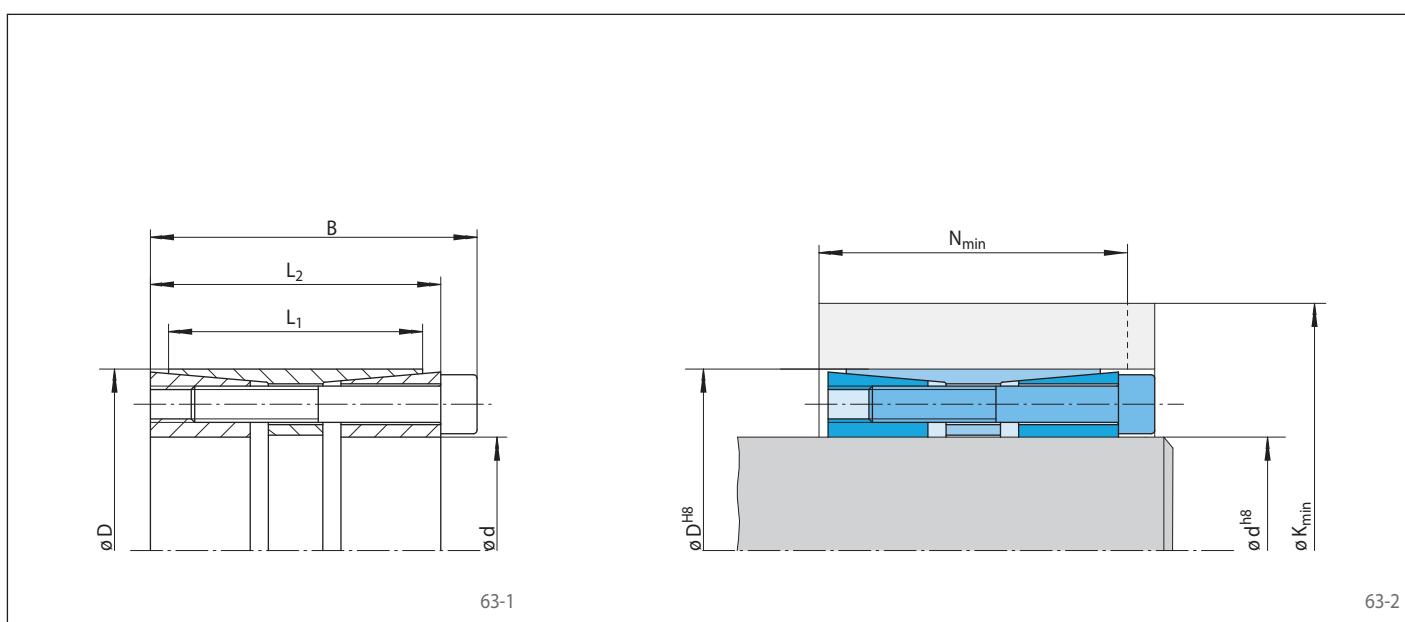

Cone Clamping Element RLK 402 TC for shaft diameter d = 100 mm:

Cone Clamping Elements RLK 404

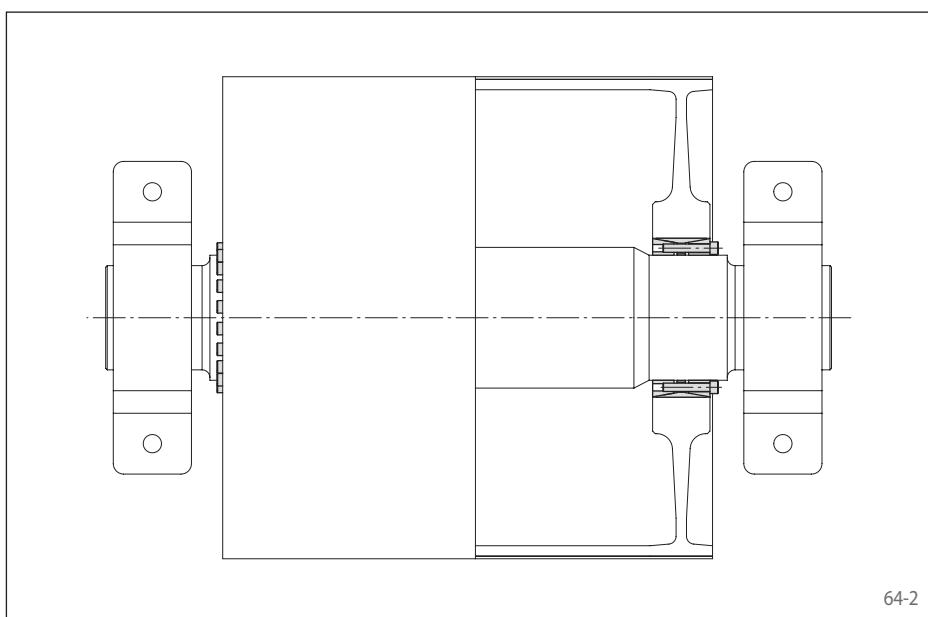

RINGSPANN®

centres the hub to the shaft
high transmissible torques

Features

- Centres the hub to the shaft
- High transmissible torques
- No axial displacement between hub and shaft during clamping procedure
- Transmissible torque of 7 000 Nm up to 1 206 000 Nm
- For shaft diameters between 70 mm and 600 mm

Application example

Backlash free attachment of a belt drum to the drive shaft of a conveyor belt with an Cone Clamping Element RLK 404. The Cone Clamping Element centres the belt drum on the drive shaft. As no axial shift occurs during the clamping process, the axial position of the belt drum in relation to the drive shaft remains unchanged.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 404.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

Cone Clamping Element RLK 404 for shaft diameter d = 100 mm:

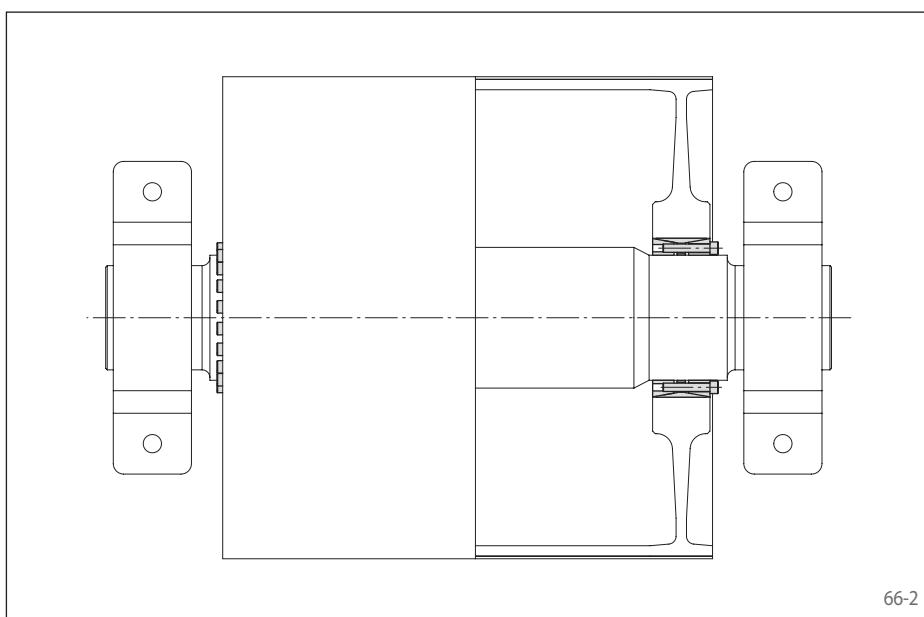

- RLK 404, size 100 x 145
Article number 4205-100401-000000

Premium quality for high centering accuracy
Can be assembled multiple times

Features

- Centres the shaft to the hub. Double slot for high centering accuracy.
- Can be assembled multiple times
- High transmissible torque
- No axial displacement between hub and shaft during clamping procedure
- Highest machining quality
- Transmissible torque of 7 000 Nm up to 1 206 000 Nm
- For shaft diameters between 70 mm and 600 mm

Application example

Backlash free attachment of a belt drum to the drive shaft of a conveyor belt with an Cone Clamping Element RLK 404 TC. The Cone Clamping Element centres the belt drum on the drive shaft. As no axial shift occurs during the clamping process, the axial position of the belt drum in relation to the drive shaft remains unchanged.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- h8 for shaft diameter d
- H8 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore: $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements RLK 404 TC.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

Cone Clamping Element RLK 404 TC for shaft diameter d = 100 mm:

- RLK 404 TC, size 100 x 145
Article number 4205-100401-TC0000

Cone Clamping Elements Trantorque Mini - metric

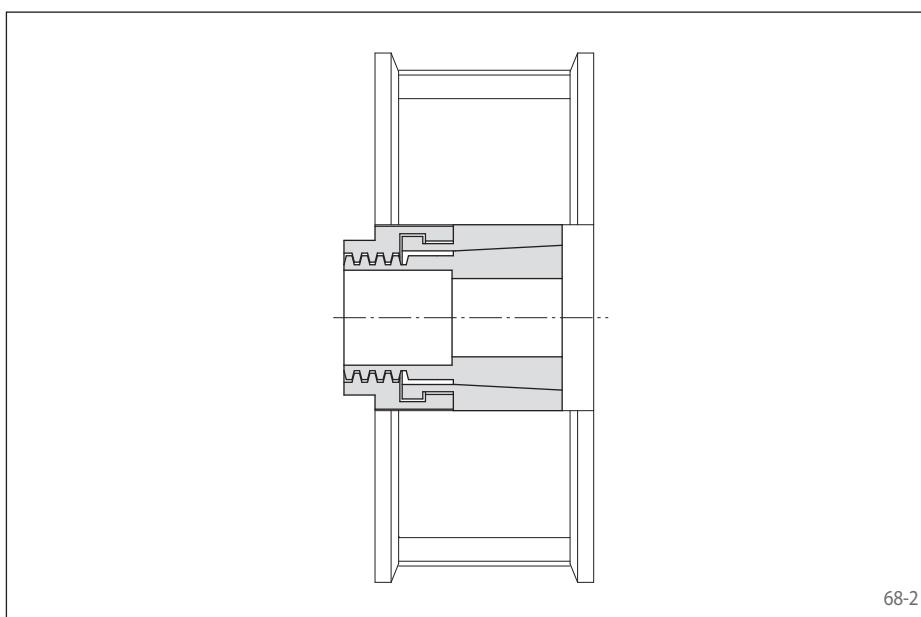

RINGSPANN®

for smallest shaft diameters
excellent concentricity

Features

- For smallest shaft diameters between 3 mm and 16 mm
- Transmissible torque of 10 Nm up to 140 Nm
- Excellent concentricity and transmission of bending moments

Application example

Cone Clamping Element Trantorque Mini provides a solution for mounting components in tight spaces on very small shafts, such as for a belt pulley.

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- for shaft diameter $d \pm 0,04$ mm
- for hub bore $D \pm 0,04$ mm

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore:
 $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

During selection of the shaft material the contact pressure P_W of the particular size has to be observed.

Installation

Please request our installation and operating instructions for Cone Clamping Elements Trantorque Mini.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Example for ordering

Cone Clamping Elements Trantorque OE - metric

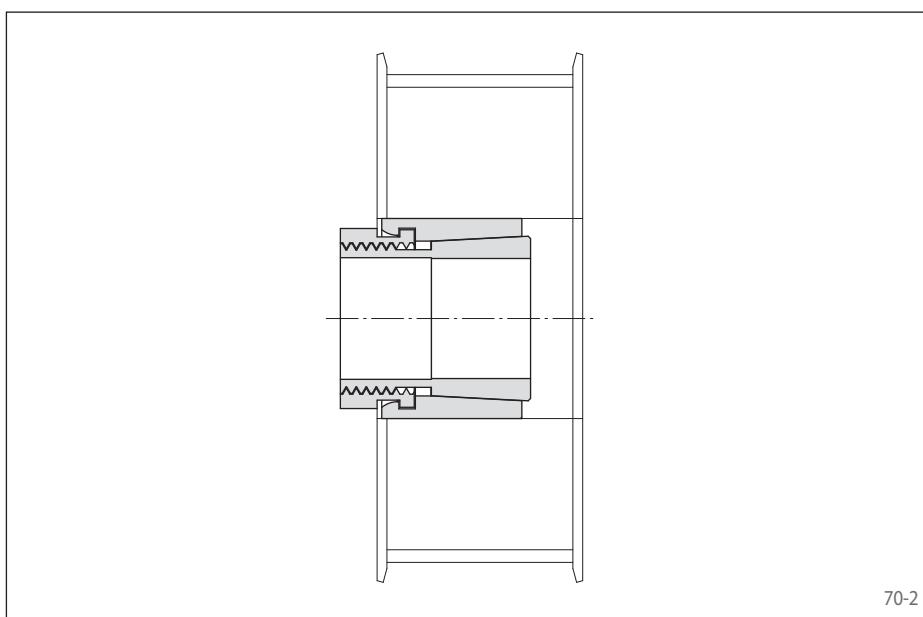

RINGSPANN®

for small shaft diameters
excellent concentricity

Features

- For small shaft diameters between 17 mm and 35 mm
- Transmissible torque of 211 Nm up to 658 Nm
- Excellent concentricity and transmission of bending moments
- Radial flat height

Transmissible torques and axial forces

The transmissible torques or axial forces listed on the following page are subject to the following tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Tolerances

- for shaft diameter $d \pm 0,08$ mm
- for hub bore $D \pm 0,08$ mm

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore:
 $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

- E-module $\geq 170 \text{ kN/mm}^2$

Installation

Please request our installation and operating instructions for Cone Clamping Elements Trantorque OE.

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0 \text{ kN}$ and conversely, the indicated axial forces F apply to torques $M = 0 \text{ Nm}$. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced. Please refer to the technical points on pages 72 and 73.

Technical Points for Cone Clamping Elements

Clamping screw tightening torque

The tightening torque M_S listed in the tables must be achieved during assembly and must not be exceeded by more than 10%. If the indicated tightening torque M_S is not achieved,

the transmissible torque or axial force, as well as the contact pressures at the shaft and at the hub will be proportionally reduced compared to the values listed in the tables for M or F as well as for

P_W and P_N . When the indicated tightening torque M_S is undercut by more than 30%, please contact us.

Preload force for RLK 300

The preload force is achieved by clamping screws to be provided by the customer, with the tightening torque M_S and the preload force for metric screws E_S to be taken from the table to the right.

The preload forces indicated in the table are corrected for friction value deviations.

Size	Preload Force E_S [kN]			Tightening torque for $\mu_k=0,1$ M_S [Nm]

Number z and size of the clamping screws are to be chosen so that

$$z \cdot E_S = E_1 \text{ or } E_2$$

For RLK 300, the preload force E_1 or E_2 may be increased or decreased as compared to the value indicated in the table. M, F, P_W and P_N change approximately proportionally. When the preload force is exceeded by more than double the value or lower by more than half the value indicated in the table, please contact us.

Design security

On page 8, the RINGSPANN calculation method for determination of the preload forces according to common friction-coefficient fluctuations is explained. As already shown there, the transmissible torques M and axial forces F listed in the tables are calculated based on the minimum preload force F_S , whereas the required hub outer diameters K_{min} are calculated based on the maximum preload force F_S . This assumes that the screw tightening torques M_S assumed in the table are exceeded by 10%.

The calculation for the elements RLK 300, assumes that the preload force of the clamping screws provided by the customer is distributed accordingly.

In the interest of the best design security, the following assumptions were made for the calculation of the Cone Clamping Elements:

For calculating	Assumed preload force	
	for all series except RLK 300	for series RLK 300
M and F	Lower limit value F_S	87% of the table value E_1 or E_2
P_W and P_N	Middle limit value F	table value E_1 or E_2
K_{min}	Upper limit value F_S	128% of the table value E_1 or E_2

Simultaneous transmission of torque and axial force

The transmissible torques M which are shown in the tables apply for axial forces $F = 0$ kN and conversely, the indicated axial forces F apply to torques $M = 0$ Nm. If torque and axial force are to be transmitted simultaneously, the transmissible torque and the transmissible axial force are reduced compared to the values listed in the tables for M and F.

For a given axial force F_A , the reduced torque M_{red} is calculated as:

$$M_{red} = \sqrt{M^2 - (F_A \cdot \frac{d}{2})^2}$$

For a given torque M_A , the reduced axial force F_{red} is calculated as:

$$F_{red} = \frac{2}{d} \sqrt{M^2 - M_A^2}$$

Bending moments

Where there are bending moments in addition to the torque M_A or the axial force F_A , the transmissible torque or transmissible axial force is reduced compared to the values for M or F as listed in the tables. Please contact us.

Hollow shafts

When clamping Cone Clamping Elements on hollow shafts, the tangential stress σ_{twi} must not exceed the yield strength R_e of the hollow shaft material. For double arrangements of Cone Clamping Elements RLK 300, assume twice the value for L_1 .

$$\sigma_{twi} = 1,27 \cdot P_W \cdot \frac{2}{1 - C_W^2} \text{ with}$$

$$C_W = \frac{d_{wi}}{d}$$

Hub Design

For the different Cone Clamping Element series, the tables list the required hub width N_{min} and the required hub outer diameter K_{min} for three exemplary yield strengths R_e of the hub. Thereby, the hub is to be arranged as seen in figure 73-1 for Cone Clamping Elements with a fixed backstop point. For Cone Clamping Elements without a fixed backstop point, the hub is to be arranged according to figure 73-2. For this, we practically assume that the screw heads of the Cone Clamping Element are flush with the hub on one side.

When the hub width in the application N_A is smaller than the required hub width N_{min} and the yield strengths R_e of the hub material is known, the required hub outer diameter K_{min} can be calculated approximately as follows:

$$K_{min} = 1,2 \cdot D \cdot \frac{H - 1,25}{H - 3} \text{ with}$$

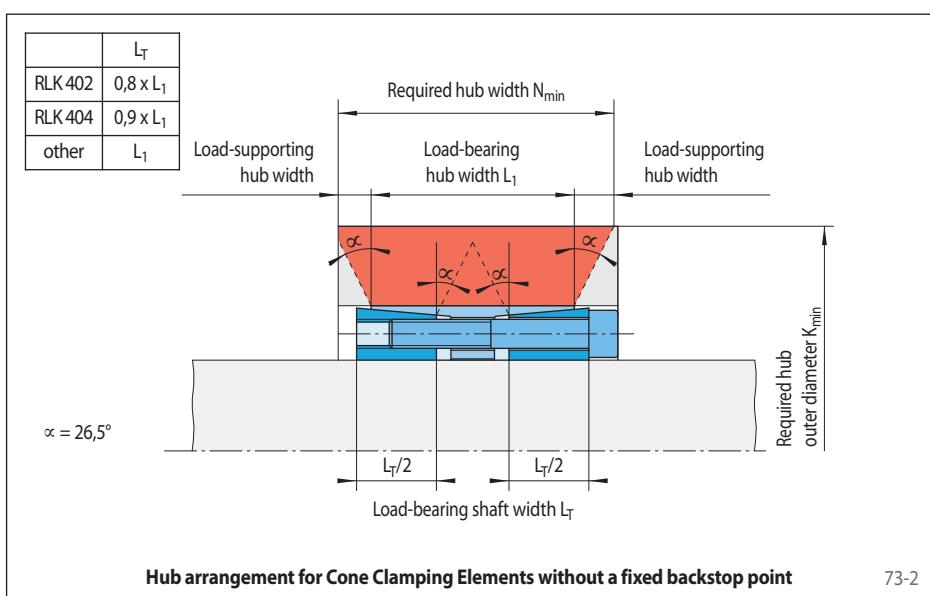

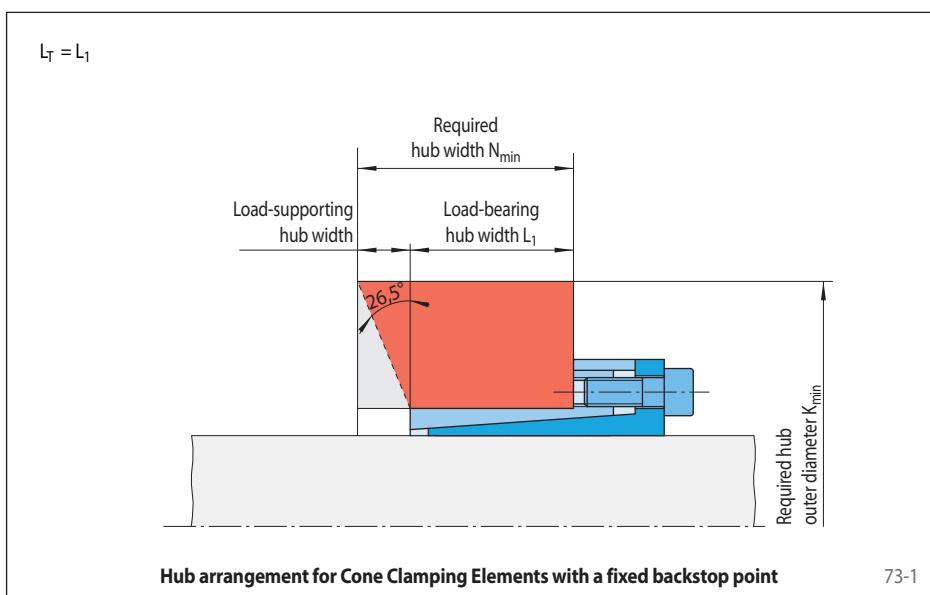

$$H = \left(\frac{R_e}{1,27 \cdot P_N} \cdot \frac{N_A}{L_T} \right)^2$$

When the hub width N_A is known and the hub outer diameter K_A is known, the hub material yield strength R_e must be higher than the equivalent stress σ_v in the hub.

$$\sigma_v = 1,27 \cdot P_N \cdot \frac{L_T}{N_A} \cdot \frac{\sqrt{3 + C_N^4}}{1 - C_N^2} \text{ with}$$

$$C_N = \frac{D}{K_A}$$

The load-bearing hub width N_A in the application must not be smaller than the load-bearing hub width L_1 .

The RINGSPANN Star Disc is a flat conical ring made of special hardened spring steel. The characteristic slot pattern, alternating from the outside to the inside edge, gives the Star Discs its very high elasticity. The outer circumference of the Star Disc is supported in the bore of the hub to be connected. The axial actuating force applied to the inner circumference of the Star Disc causes an elastic change in the conical angle and thus reduces the inner circumference of the Star Disc (see figure 74-1). A particular advantage of this configuration is that the axial actuating force is converted virtually without friction loss into a much higher radial force. This facilitates simple actuating devices, such as clamping with the aid of a central clamping screw or a manually adjusted knurled nut, for example.

Depending upon the torque required, Star Discs are used singly or in multiple arrangements as disc packs, generally consisting of a maximum of 16 discs. This arrangement provides for space-saving, clamping connections.

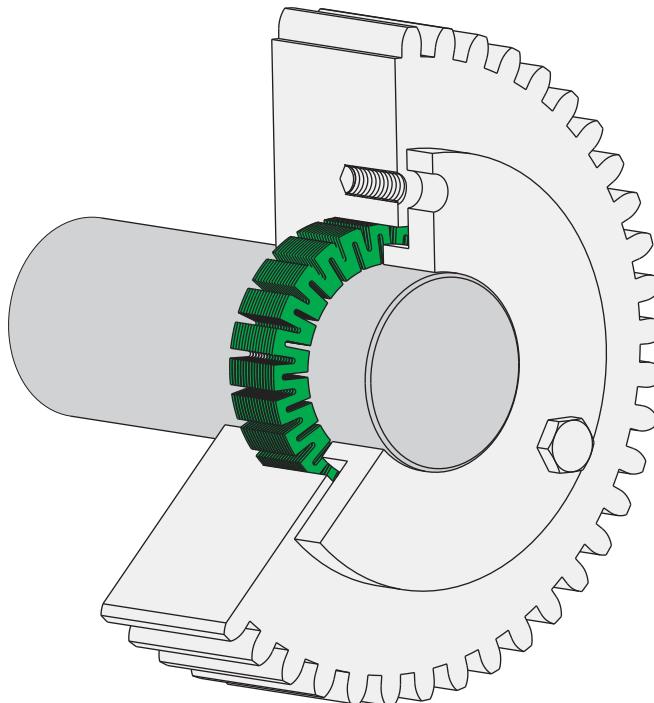

Clamping connections with Star Discs are easy to release even after frequent clamping. This makes the Star Disc the ideal clamping element, e.g. in adjustment devices.

74-1

Features

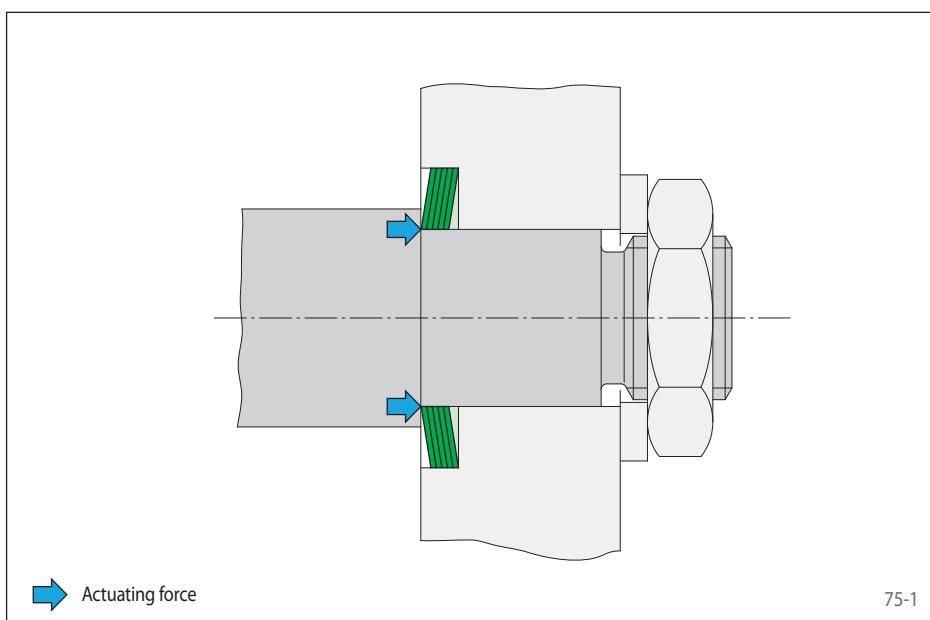

- For frequent clamping and release
- Short axial width
- Adjustable to the required torque by multiple arrangements in the form of disc packs
- Low actuating force required, thus ideal for manual actuation

74-2

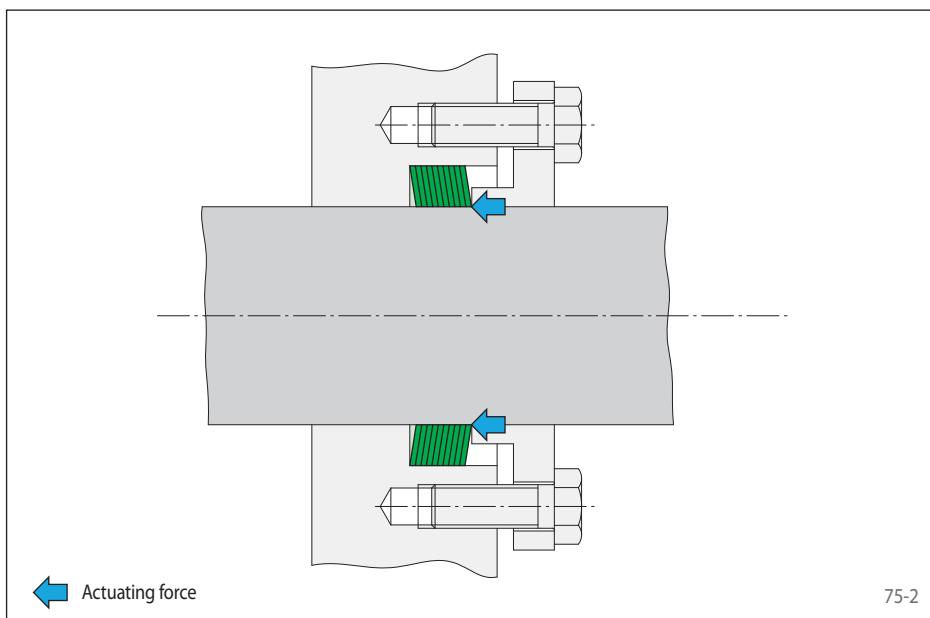

Clamping connection at the shaft end

Figure 75-1 shows a clamping connection with a disc pack that consists of five Star Discs. The preload force of the clamping nut is transmitted to the disc pack by the opposite shaft shoulder.

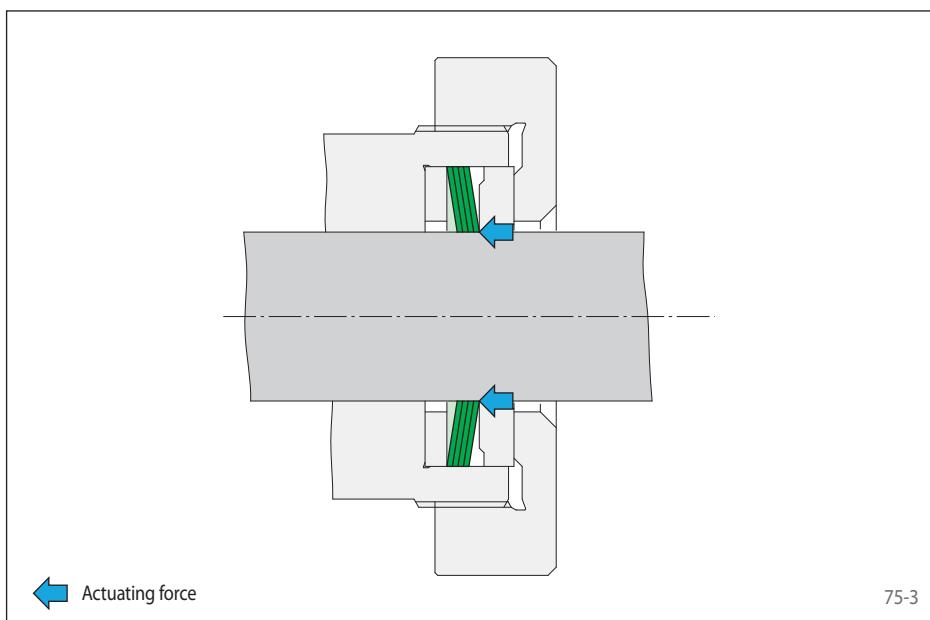

Clamping connection on a continuous shaft

Figure 75-2 shows a clamping connection with a disc pack consisting of ten Star Discs. The preload force of the screws acts on the disc set through a clamping flange.

Clamping connection with a threaded ring

Figure 75-3 shows a clamping connection with a disc pack consisting of four Star Discs and a manually adjusted threaded ring. Between the disc pack and the threaded ring, there is a pressure disc. It transmits the axial actuation force to the disc pack inner diameter and thereby prevents the disc pack from turning as well when the threaded ring is tightened.

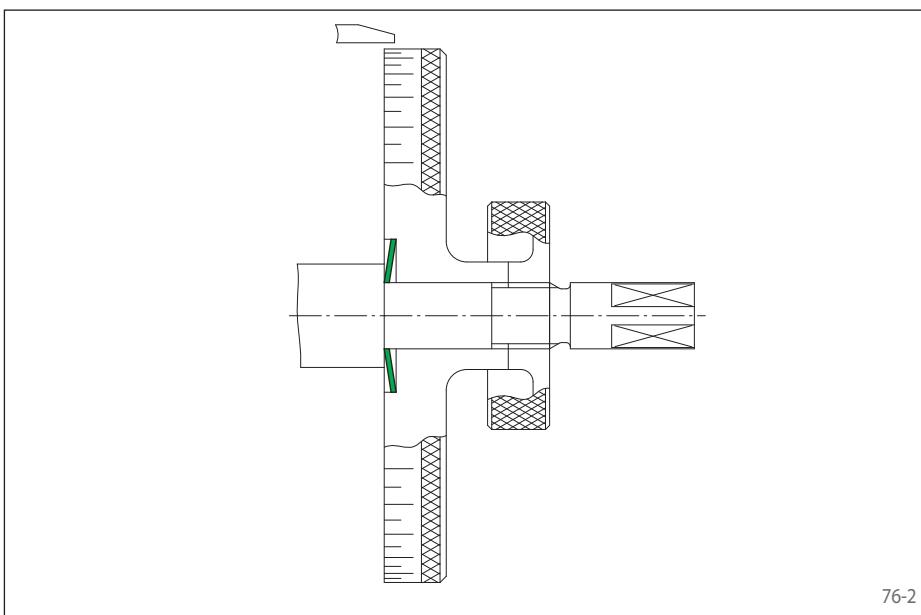

for frequent clamping and loosening short axial width

Features

- For frequent clamping and release
- Short axial width
- Adjustable to the required torque by multiple arrangements in the form of disc packs
- Low actuating force required, thus ideal for manual actuation

Application example

Backlash free attachment of a graduated dial in a feed unit with a Star Disc. After release of the right knurled nut, the dial can be adjusted in circumferential direction.

Transmissible torques

The transmissible torques or axial forces listed on the following page are subject to the following information about disc pack, tolerances, surface characteristics and material requirements. Please contact us in the case of deviations.

Disc Pack

The torque M stated in the table applies for one star disc. In case of multiple arrangements of star discs in disc packs of up to 16 star discs, the following applies:

$$\text{Torque} \quad M_n = n \cdot M$$

$$\text{Preload force} \quad E_n = n \cdot E$$

$$\text{Load-bearing axial width} \quad L_1 \approx n \cdot s$$

Tolerances

- h9 for shaft diameter d
- H9 for hub bore D

Surfaces

Average surface roughness at the contact surfaces between the shaft and the hub bore:
 $R_z = 10 \dots 25 \mu\text{m}$.

Materials

The following apply to the shaft and the hub:

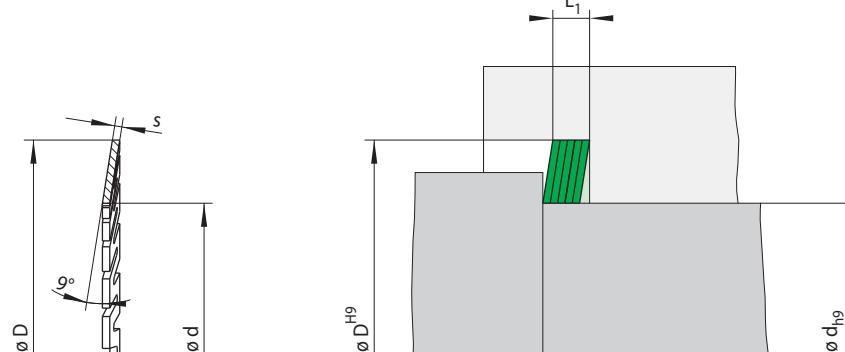

- Yield strength $R_e \geq 300 \text{ N/mm}^2$
- E-module $\geq 170 \text{ kN/mm}^2$

Example for ordering

100 Star Discs for shaft diameter d = 20 mm:

Technical Points for Star Discs

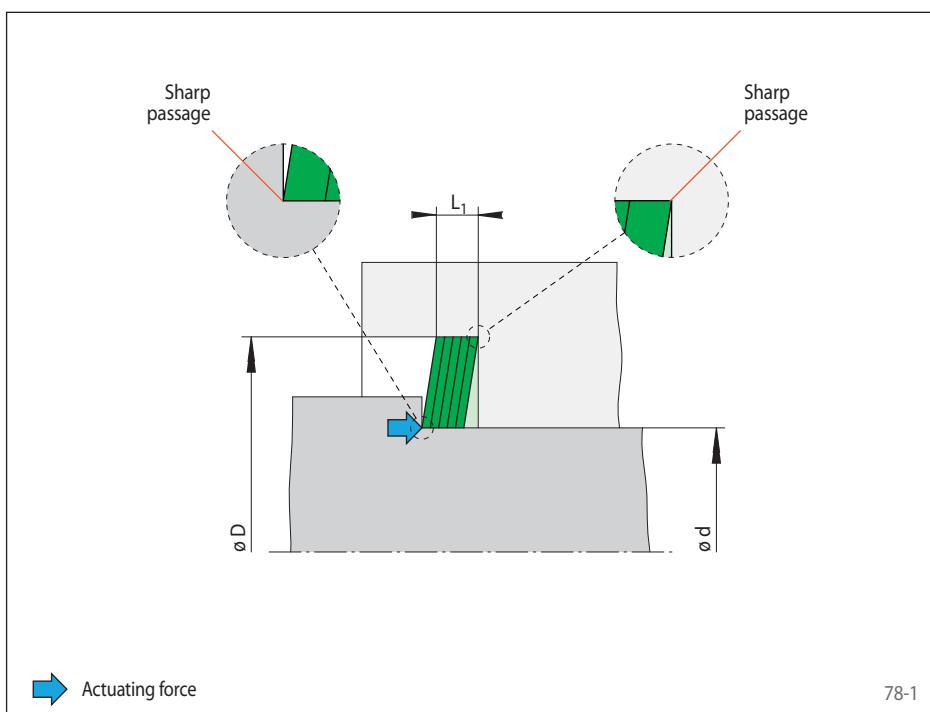

Design points

The outer diameter D of the Star Disc is supported in the bore of the hub to be connected. The Star Disc seats with the concave face of the cone against the fixed backstop point of the hub. The axial actuation force must be applied opposite at the front side of the inner diameter d.

The passages from shaft diameter d and supporting diameter D to the respective plane surfaces must be sharp-edged, without corner arc or undercut.

The shaft must be centred according to the requirements.

If a torque M_A and an axial force F_A are to be transmitted at the same time, please contact us.

78-1

Frequent clamping and release

Clamping connections with Star Discs can be easily released repeatedly. They can be clamped and released up to 5 000 times. Star Discs from

size A 080 060 IV are durable and not subject to this limitation.

For loosening the clamping connection, displace the hub against the shaft

Preload force

The preload force is achieved by clamping screws to be provided by the customer, with the tightening torque M_S and the preload force for metric screws E_S to be taken from the table to the right.

The preload forces indicated in the table are corrected for friction value deviations.

Size	Preload force E_S [kN]			Tightening torque for $\mu_k=0,1$ M_S [Nm]		
	8,8	10,9	12,9	8,8	10,9	12,9
M 4	3,8	5,5	6,7	2,6	3,9	4,5
M 5	6,3	9,4	11,0	5,2	7,6	8,9
M 6	9,1	13,2	15,5	9,0	13,2	15,4
M 8	16,3	24,0	28,2	21,6	31,8	37,2

Number z and size of the clamping screws are to be chosen so that

$$E \text{ or } E_n = z \cdot E_S \cdot 1000$$

If the preload force E or E_n is exceeded, the Star Disc will be overstressed or the permissible contact pressure will be exceeded.

Disc Pack

Star Discs are used separately or combined to disc packs according to the required torque. For multiple arrangements in a disc pack of $n = 16$ Star Discs, the following applies:

$$\text{Torque} \quad M_n = n \cdot M$$

$$\text{Preload force} \quad E_n = n \cdot E$$

$$\text{Load-bearing axial width } L_1 \approx n \cdot s$$

For disc packs with more than 16 Star Discs, any Star Discs exceeding 16 will only transmit approx. 50% of the torque M. The maximum number of Star Discs in a pack is limited to 25.

Hollow Shafts

When clamping Star Discs on hollow shafts, the tangential stress σ_{tWi} must not exceed the yield strength R_e of the hub material.

$$\sigma_{tWi} = 1,27 \cdot P_W \cdot \frac{2}{1 - C_W^2} \quad \text{with}$$

$$C_W = \frac{d_{Wi}}{d}$$

Hub Design

The contact pressure P_W leads to radial stress in the shaft that is usually not critical for solid steel shafts.

There is always a tangential stress σ_t in the hub, and for thin-walled hubs it may be a multiple of the initiated pressure P_N . The amount of the applicable tangential stress depends on the load-bearing hub width N_{min} , the hub outer diameter K_{min} and the pressure P_N . For the load-bearing hub width N_{min} is taken into account, that the hub pressure P_N is carried by the load-bearing width L_1 , and in an angle of ca. 26,5° beyond it (see figure 79-1).

When the load-bearing hub width N_A and the yield strength R_e of the hub material are given, the required hub outer diameter K_{min} can be calculated approximately as follows:

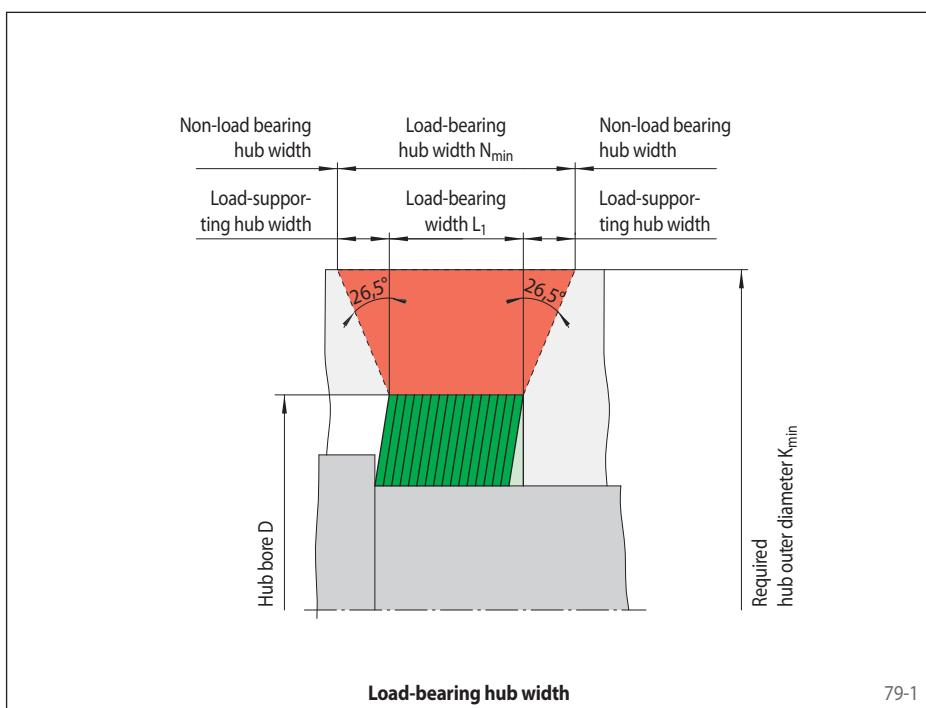

$$K_{min} = 1,2 \cdot D \cdot \frac{H - 1,25}{H - 3} \text{ with}$$

$$H = \left(\frac{R_e}{1,27 \cdot P_N} \cdot \frac{N_A}{L_1} \right)^2$$

When the hub width N_A and the hub outer diameter K_A are given, the hub material yield strength R_e must be higher than the equivalent stress σ_v in the hub.

$$\sigma_v = 1,27 \cdot P_N \cdot \frac{L_1}{N_A} \cdot \frac{\sqrt{3 + C_N^4}}{1 - C_N^2} \text{ with}$$

$$C_N = \frac{D}{K_A}$$

The advantage of torque motors can be fully exploited only if the torque motor is connected to the machine shaft in an appropriate manner for the application in question. RINGSPANN has developed Clamping Systems that meet the specific requirements of both torque motors and machine shafts which are often configured as thin-walled hollow shafts.

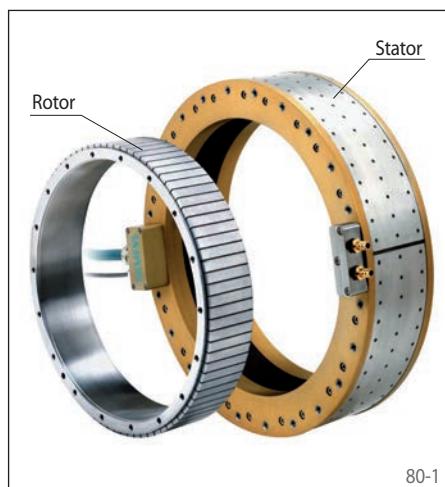

Both complete torque motors and integrated torque motors can be connected by friction to machine shafts with RINGSPANN torque motor clamping systems. In addition to secure, backlash free torque transmission, these systems also ensure precise centring of the torque motor on the machine shaft.

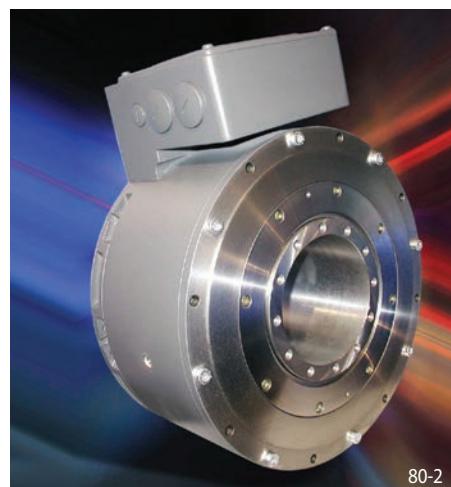

Torque motors

Torque motors are rotation angle controlled, permanent magnet excited synchronous servo-motors with large numbers of magnetic pole pairs which produce correspondingly high torques in the lower rpm range (0 - approximately 250 rpm, depending on the number of pole pairs). Thanks to modern high performance electronics, torque motors, as direct drive motors, are capable of meeting such system requirements as high repetition and control accuracy, low energy consumption, low noise levels, high dynamics, ease of maintenance and reduced space requirements.

Torque motors are designed as „integrated torque motors“ (Fig. 80-1) with rotors and stators or as self-enclosed „complete torque motors“ with bearings (Fig. 80-2).

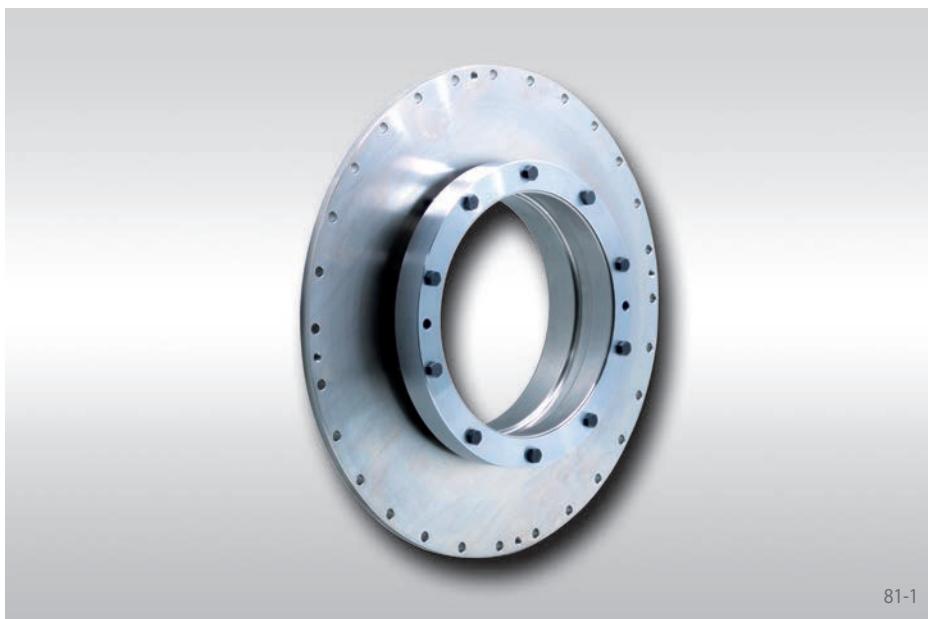

Source: Siemens AG

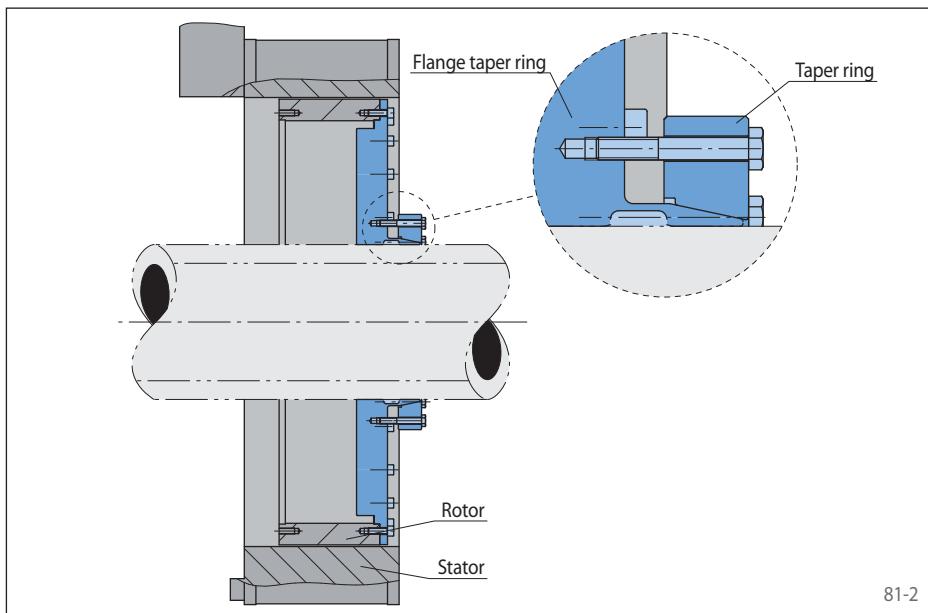

Source: Siemens AG

for integrated torque motors
for mounting and centring rotors on shafts or hollow shafts

Features

- Provides a mechanical connection and centring between rotor and machine shaft
- Backlash free, torsion-proof transmission of torque generated by the torque motor
- High true run accuracy between rotor and a stator mounted on the machine
- Low contact pressures exerted on machine shafts or hollow shafts
- Taper Collet chemically nickel-coated to prevent fretting corrosion
- Easily removable clamping element, even after long periods of operation

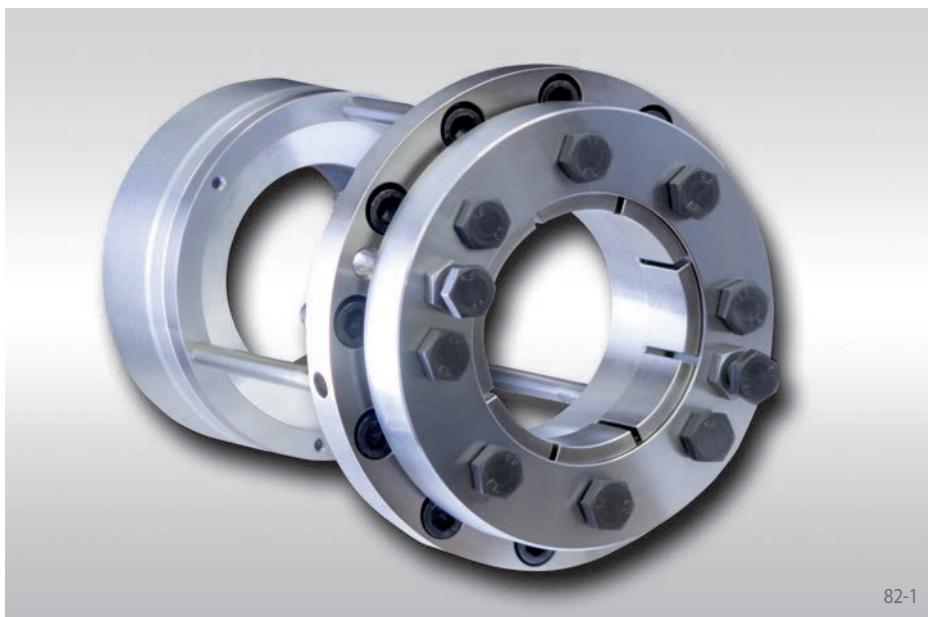

Configuration

The Clamping System RTM 601 consists of a flange taper ring and taper ring. The taper ring clamps the flange taper ring to the machine shaft with the aid of clamping screws in such a way that the torque generated between the stator and rotor of the integrated torque motor is transmitted to the machine shaft via a frictional, backlash free connection.

If you have an application for which the Clamping System RTM 601 is suited, please submit your enquiry, including the designation of the torque motor to be used as well as the shaft dimensions.

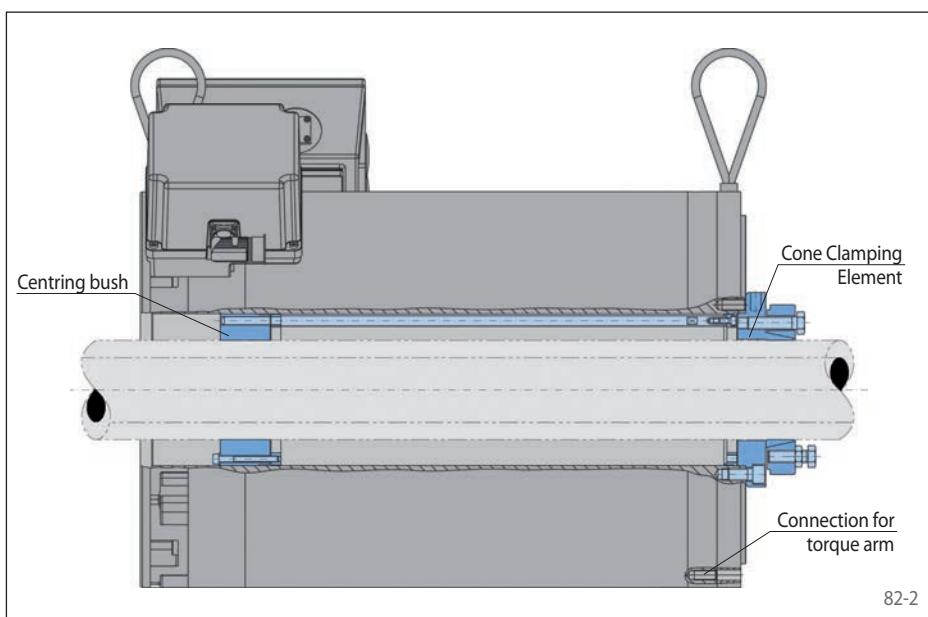

for SIEMENS complete torque motors 1FW3

for mounting and centring complete torque motors on shafts or hollow shafts

Features

- Provides a mechanical connection, support and centring between rotor and machine shaft
- Backlash free, torsion-proof transmission of torque generated by the torque motor
- High true running accuracy
- Optimally configured contact pressure prevents undesirable deformation of hollow machine shafts
- Taper Collet chemically nickel-coated to prevent fretting corrosion
- Easily removable Cone Clamping Element, even after long periods of operation
- Centring bush can be mounted from the B-side of the torque motor

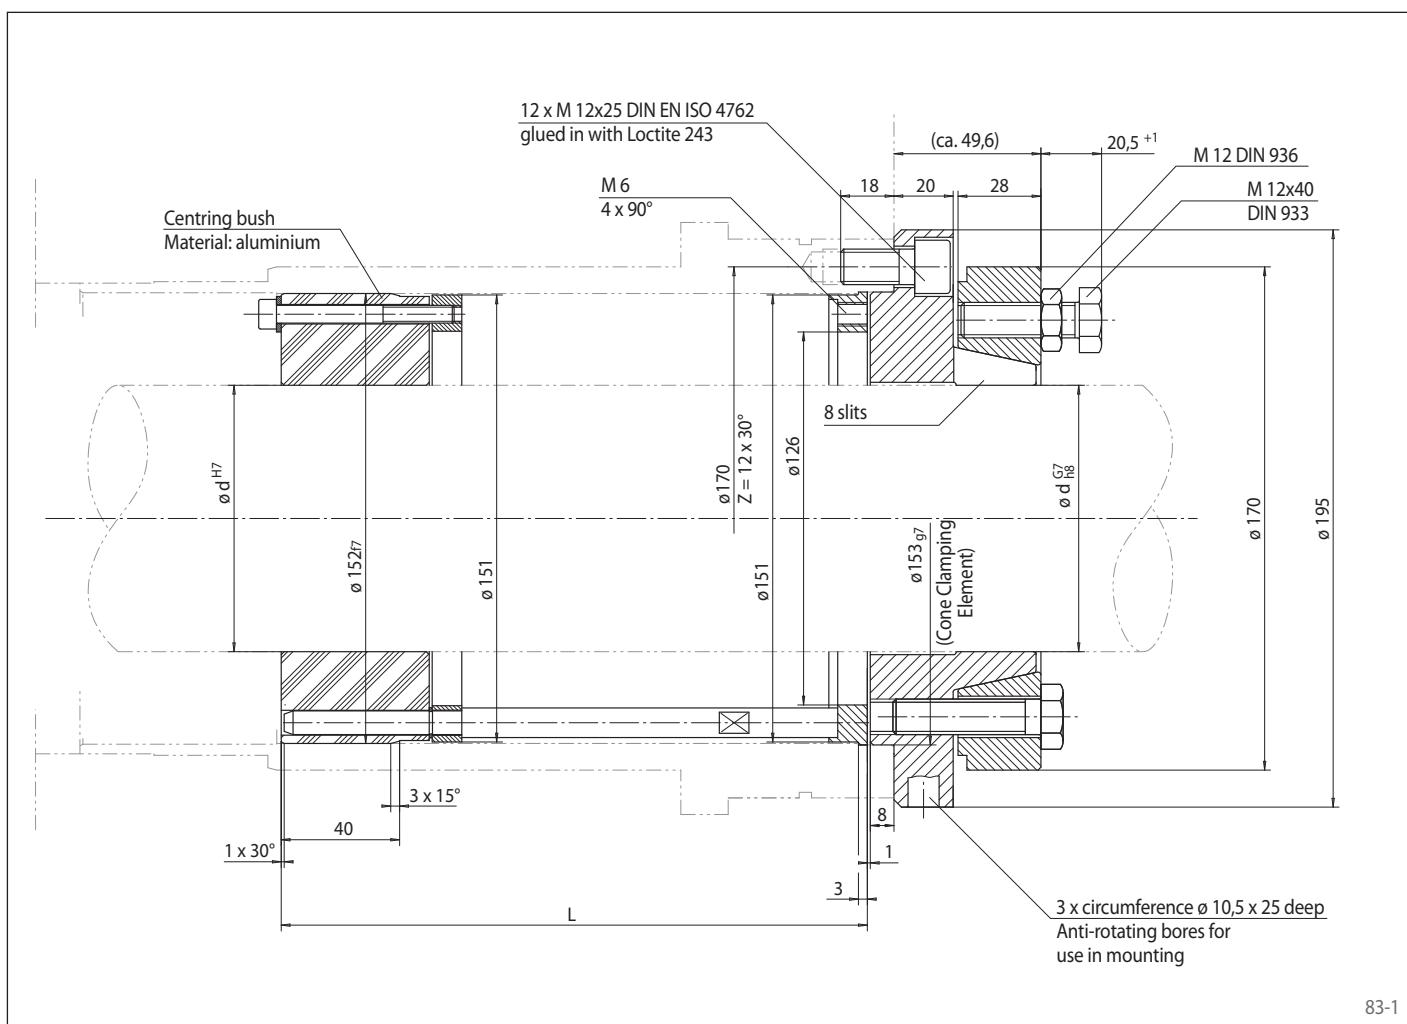

Configuration

The Clamping System RTM 607 consists of a Cone Clamping Element and a centring bush. The Cone Clamping Element ensures that motor torque is transmitted reliably to the machine shaft and centres the torque motor on the drive side. A second centring unit consisting of an aluminium centring bush ensures good overall alignment of the torque motor with the machine shaft.

The centring bush is secured in its axial position with the aid of rods and a stop ring.

Example for ordering

Clamping System RTM 607 for SIEMENS complete torque motors 1FW3 204 for shaft 90 mm:

- RTM 607-090, L = 313 mm

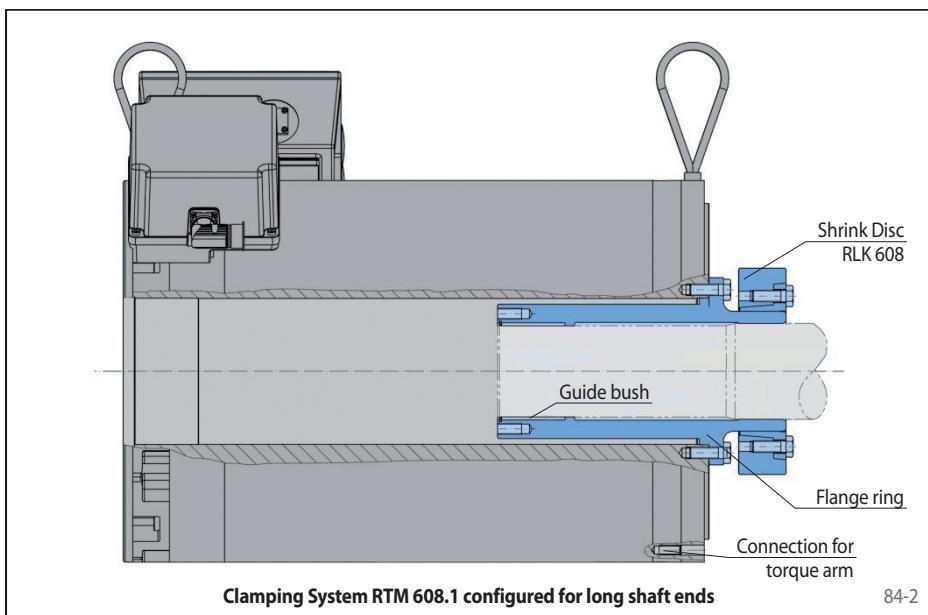

for complete torque motors

for mounting and centring complete torque motors on shafts or hollow shafts

Features

- Provides a mechanical connection, support and centring between rotor and machine shaft
- Backlash free, torsion-proof transmission of torque generated by the torque motor
- High true running accuracy
- For inexpensive clamping on solid shafts
- Easily removable Cone Clamping Element, even after long periods of operation

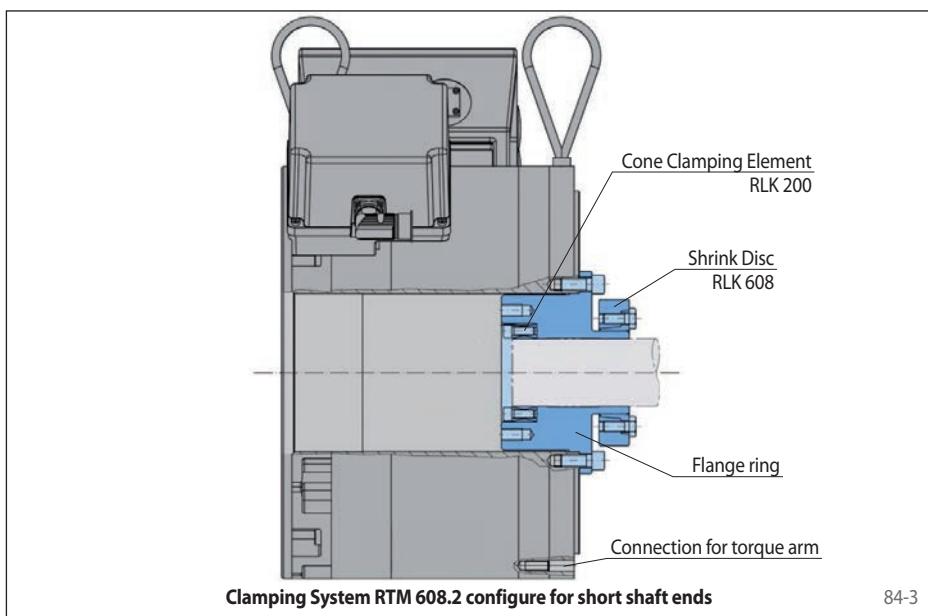

Configuration

The Clamping System RTM 608 consists of a flange ring and a Shrink Disc RLK 608. The flange ring connects the torque motor to the machine shaft.

In contrast to the Clamping System RTM 607, the torque motor is centred on the Clamping System in a "flying" configuration. The Clamping System RTM 608 can be compared to a flange shaft, but offers the added advantage that a cylindrical shaft end remains following removal of the Clamping System RTM 608, facilitating trouble-free replacement of machine gaskets and bearings.

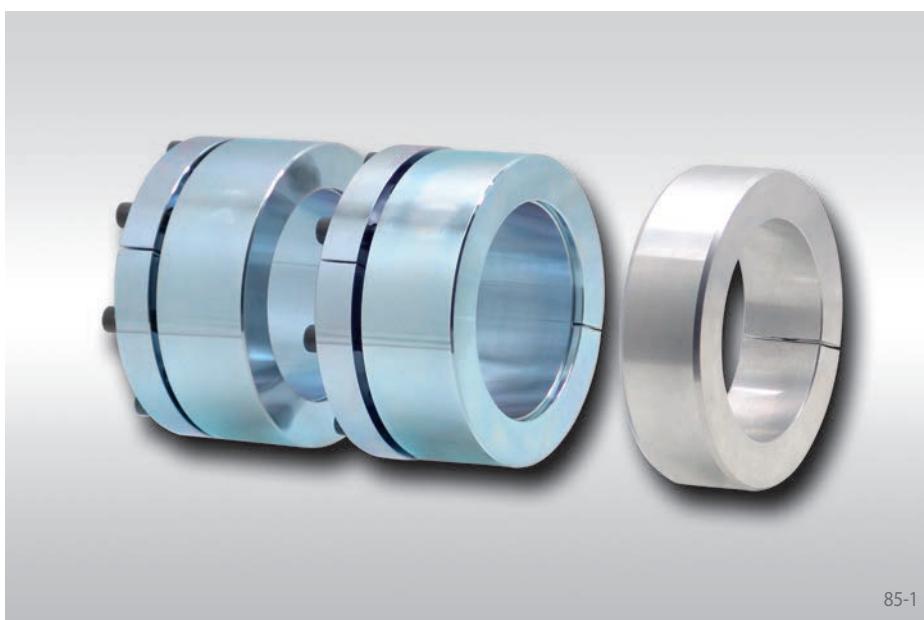

The Clamping System RTM 608 performs two functions in the area in contact with the machine shaft. Torque transmission is effected with the aid of a two-part Shrink Disc RLK 608. The second support point is configured with a glide bush, which helps prevent fretting corrosion resulting from microslippage (Fig. 84-2). In the case of short shaft ends, a Cone Clamping Element RLK 200 is used instead of the glide bush as a second support point in order to ensure the required true run accuracy of the torque motor in relation to the machine shaft (Fig. 84-3).

If you have an application for which the Clamping System RTM 608 is suited, please submit your enquiry, including the designation of the torque motor to be used as well as the shaft dimensions.

for complete torque motors

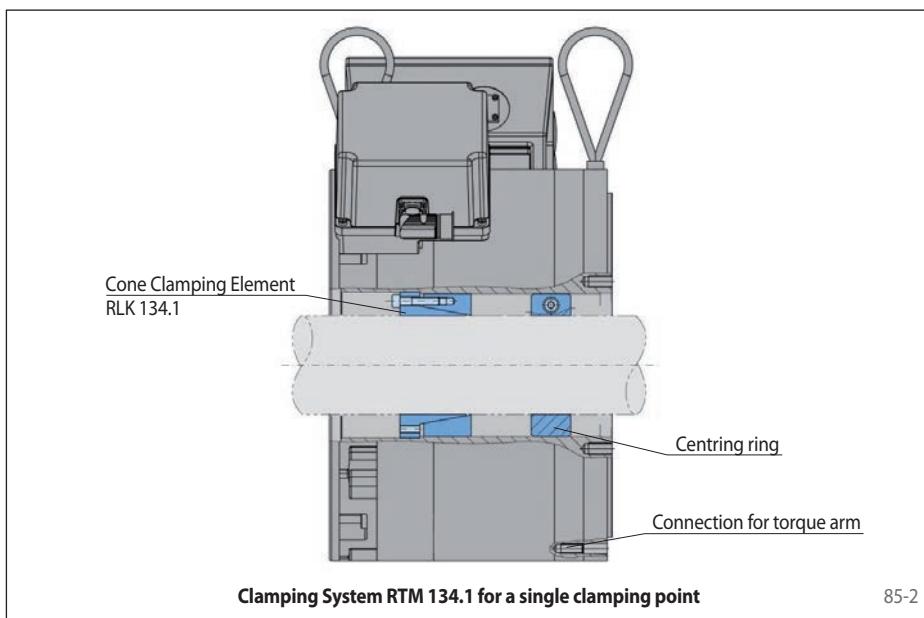

for mounting and centring complete torque motors on shafts or hollow shafts

85-1

Features

- Provides a mechanical connection and centring between rotor and machine shaft. Support is provided by additional centring ring
- Backlash free, torsion-proof transmission of torque generated by the torque motor
- High true running accuracy
- Optimally configured contact pressure prevents undesirable deformation of the hollow rotor shaft of the torque motor and the hollow machine shaft
- Taper Collet galvanized and blue-chromed to prevent fretting corrosion
- Easily removable Cone Clamping Elements, even after long periods of operation
- Cone Clamping Elements can be mounted from the B-side of the torque motor

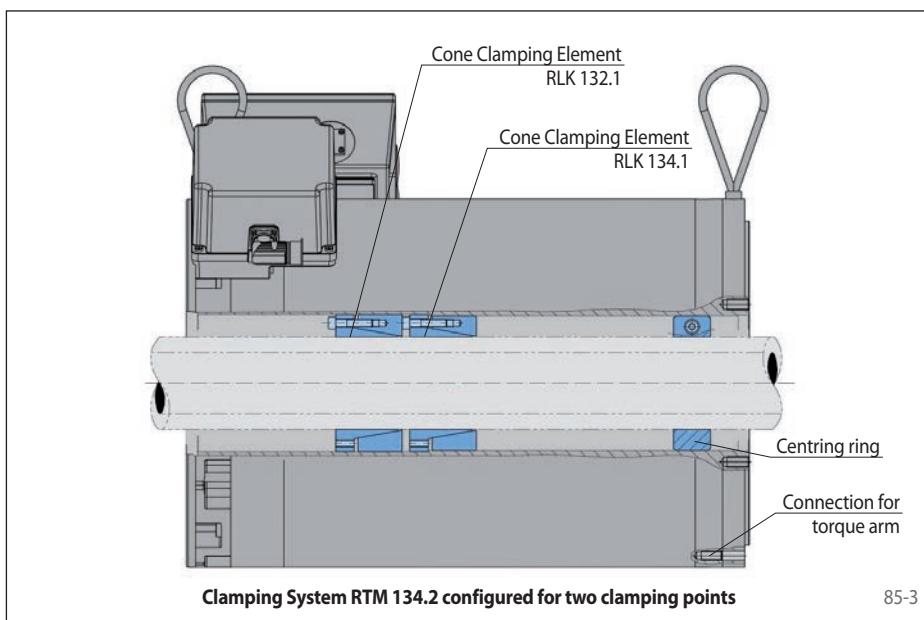

Clamping System RTM 134.1 for a single clamping point

85-2

Configuration

Depending on the amount of torque to be transmitted between the machine shaft or hollow shaft and the torque motor, either one or two Cone Clamping Elements are used for torque transmission and a centring ring as a second support point are used. The Cone Clamping Elements have been developed in keeping the specific requirements of torque motors. The taper angle is designed in such a way that the Cone Clamping Elements can be removed easily, even after extended periods of operation, and no undesirable contact pressures cause indentations on the torque motor rotor shaft, which is ordinarily a thin-walled element.

The torque motor manufacturer should be consulted prior to installing this Clamping System. Therefore, we request submission of your enquiry in the event that a Clamping System this kind is considered suitable for your application.

Clamping System RTM 134.2 configured for two clamping points

85-3

as ball bearing compensating discs for taking up free movement in bearings

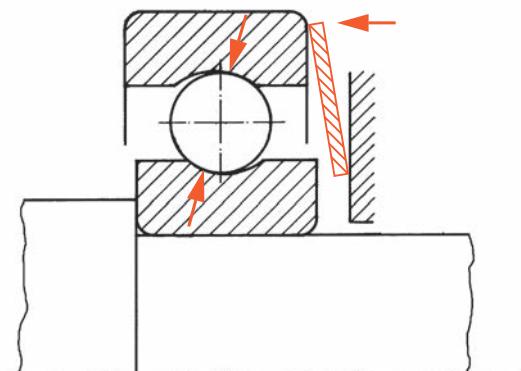

Features

- RINGSPANN Star Spring Washers are particularly light spring elements with linear or not-linear spring characteristic. They are suitable for application as pressure elements in precision machines and as pressure springs for taking up free movement, and for reducing noise in ball bearings.
- The very large axial movement of the spring guarantees that considerable axial variations and length tolerances can be accommodated without much deviation from the nominal value of the axial force of the Star Spring Washer.
- Because of the large axial variations of the spring it is often possible to achieve the desired effect with a single Star Spring Washer.
- Their spring load corresponds with the optimum values of the relevant bearing sizes.

Service Life

Ball bearings give longer service if the inner and outer rings are pre-loaded axially (figure 86-2). This fact has been known for a long time. This axial preloading by RINGSPANN Star Spring Washers eliminates radial play in the ball bearings. This effects a better distribution of the radial load to be transmitted onto the bearing rings and therefore increases the length of service life of the bearing.

Inner and outer rings are pre-loaded axially

86-2

Conditions for most favourable effect

The effect of axial pre-loading depends on certain conditions:

- The axial pressure must be applied to the whole outer race.
- Axial variations and length tolerances within the components of the machine should have only the very slightest effect on the applied spring force.
- The axial pre-loading must be done with a load suitably adapted to the size of the bearing.

Protection of Bearings subject to vibration when non-rotating

The spring axial location also eliminates damage as a result of vibration in non-rotating bearings. This type of damage is well known in electric motors for auxiliary drives in ships and vehicles. If the auxiliary drives is stationary, the rotor can vibrate in the bearing, due to the vibration of the ship or vehicle. In these conditions the balls beat in the races of the bearing rings and cause wear. This is why leading manufacturers use only ball bearings, the radial play of which is removed by Star Spring Washers, so preventing any vibration of the rotor. The reason for damage is then completely eliminated.

Silent Running

High speed machines, particularly small electric motors, create special problems for the designer regarding silent running. Extensive trials in this field have shown, that in the main, noise originates in the ball bearings, and that the application of the exact amount of axial pressure suitable for each job reducing noise effectively.

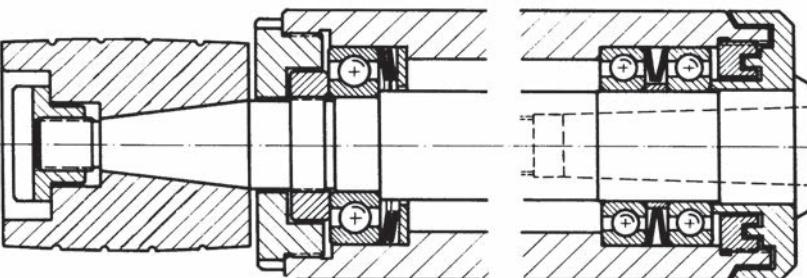

as ball bearing compensating discs for taking up free movement in bearings

Bearing of an internal grinding spindle

Spindle ball bearings are used as bearing support for grinding spindles. Bearings of this kind exhibit maximum tracking accuracy at high rotation speeds.

The specific properties of these bearings can be fully exploited only if the bearings are pre-clamped with a precisely defined force.

RINGSPANN Star Springs Washers enable you to realise the required pre-clamping force of the spindle bearings with a high degree of precision.

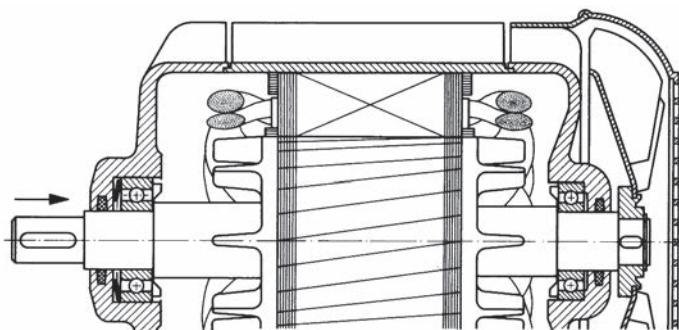

Bearing of an internal grinding spindle

87-1

Pressure spring for ball bearing

Silent running is a particular requirement for electric motors. For this purpose a RINGSPANN Star Spring Washer acts to pre-load the outer race of the bearing as illustrated.

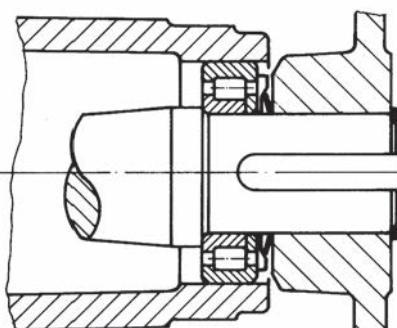

Pressure spring for ball bearing

87-2

Accommodating length tolerances

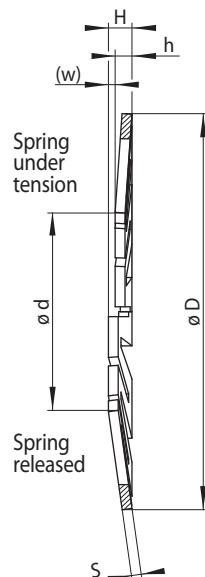

As shown in this example the RINGSPANN Star Spring Washer fitted between output shaft and NILOS sealing ring makes it possible to accommodate wide axial tolerances.

Accommodating length tolerances

Mounting

Generally it will be found most suitable for the Star Spring Washer to work on the outer ring of the ball bearing. The Star Spring Washer outside diameters given in the following table correspond therefore with the ball bearing outside diameters. The RINGSPANN design with slots and dished shape guarantees even axial pressure on the whole outer race. If an axial pressure

is applied to the shaft in one direction only, the Star Spring Washer must be mounted in such a way that there is no axial pressure on it (figure 87-2). If the axial pressures vary or are in both directions, a Star Spring Washer has to be mounted both sides of the ball bearings. In this case and in any doubtful cases we will be pleased to submit an installation proposal.

Explanation concerning the table

Apart from the listed ball bearing series the Star Spring Washers can also be used for series 32, 33, 42, 72 and 73. Pressure F is attained at height h. The spring constant c, i.e. the pressure increase per mm spring travel can only be given up to size 74 x 50 x 1,15.

With larger Star Spring Washers the spring characteristic is not linear but diminishing. With tolerances of the installation height h the pressure F therefore changes even less than with smaller washers. Up to size 129 x 98 x 1,15 the springs can be supplied plated against corrosion.
